DXpedition to Annobón 3CØAN

General, Advanced or Extra-the Heathkit "Maxi-Rig" is your ticket to the world.

The incomparable Heathkit SB-102 Transceiver. SSB/CW, 80-10 meter coverage. Still only 380.00*

The Heathkit SB-220 Linear Amplifier. 2,000 watts P.E.P. SSB input, 1 kW CW. Just 349.9

Here's exceptional stability and dial linearity — made possible by an all solid-state linear master oscillator with 1 kHz calibration. The SB-102 stabilizes itself in a fast 10-minutes, drifts less than 100 Hz per hour after initial warm-up. The new receiver section delivers an S+N/N ratio of less than 0.35 uV for 10 dB — with front-panel selection of built-in 2.1 kHz SSB crystal filter or optional 400 Hz crystal filter. And there's a dial resettable to 200 Hz; 180 W PEP SSB input, 170 W CW input; switch selection of upper or lower sideband and CW; built-in sidetone for monitoring; built-in 100 kHz crystal calibrator; triple action level control to reduce clipping and distortion; built-in VOX, and complete metering.

The SB-102 is the value leader because you build it yourself to save on initial investment and service. Simple circuit board/wiring harness construction gets it all together. Order your round-trip ticket to the world now — the famous Heathkit SB-102 SSB/CW Transceiver.

Kit SB-102, 24 lbs. **380.00***

Kit SB-600, 8 ohm matching speaker with mounting space for AC supply, 7 lbs. . . . **19.95***

SBA-301-2, 400 Hz CW crystal filter, 1 lb. **21.95***

Kit HP-23A, AC supply, 19 lbs. **51.95***

Kit HP-13A, DC supply, 7 lbs. **69.95***

SBA-100-1, mobile mount, 6 lbs. **14.95***

The Heathkit SB-220 is the linear amplifie that the competition tries to measure up t Two conservatively rated Eimac 3-500Z's in grounded grid circuit offer up to 2000 W PE SSB input, or a full 1 kW on both CW an RTTY. The broad-band pretuned pi-input de livers maximum efficiency with low distortio over 80-10 meters. Only 100 watts of drivin power is neded to produce full-rated input.

SB-220 features include a built-in solid-stat 120/240 V power supply; circuit breaker pro tection; zener diode regulating operating bia to reduce idling current for cooler runnin and extended tube life; a large quiet fan; ALC to the driving unit to prevent over-driving front panel switch selected monitoring of gri current; relative power and high voltage. Th SB-220 offers a clean, compact design wit the liberal use of internal shielding for extr strength and component isolation. Its gree table-top cabinet complements all your SB series gear.

And tune-up is fast and easy. Just set the banc switch, push the CW-Tune/SSB rocker switch to CW-Tune, adjust the Tune and Load con trols for maximum relative power. Push the rocker switch to SSB and you're ready with a full 2-gallon input to the transceiver. The Heathkit SB-220 brings your rig up to the per formance limits — order yours now!

Kit SB-220, 69 lbs. **349.95***

Designing or aligning...now you can ffford lab-grade Heathkit instruments

The new Heathkit IO-105 Dual Trace Scope. Triggered sweep, DC-15MHz, x-y mode, 8 x 10 cm flat-face CRT. For a fantastic 399.95*!

Heathkit IM-102 Digital Multimeter. digits, built-in calibration to 0.2%, lab bration to 0.1%. At an amazing 229.95*

new Heathkit IM-102 is a breakthrough in trumentation — a true digital multimeter at rice that's about half what you'd pay for nparable wired DMM's! Measures AC and voltage, current, and resistance, with auto- tic switching for DC polarity. Five overlap- g ranges show voltage from 100 uV-1000 V DC; 5 ranges cover 100 uV-500 V on AC; 10 ges measure 100 nA-2A, AC or DC; 6 resist- e ranges cover .1 ohm-20 megohms. Input pedance is 1000 megohms on the 2V range, megohms on higher ranges, with overload tection on all.

cimal point is automatically placed with ge selection. Panel light indicates over- ge.

Heath-designed DC calibrator is furnished embled with every IM-102. A unique trans- method, described in the manual, provides curate AC voltage calibration. All solid-state cuitry incorporates cold cathode readout es and a "memory" circuit to assure stable, n-blinking operation. Kit includes standard nana jack connectors complete with test ds. Assembles in approximately 10 hours. Her yours, and step up to digital instrumen- ion at analog prices.

IM-102, 9 lbs. **229.95***

ID-1041, high-voltage probe cessory, 1 lb. **6.95***

The new Heathkit IO-105 . . . Gives you full dual trace and x-y capability. Separate signal display in Channel 1 or Channel 2 mode, direct comparison of both signals in alternate or chopped modes, both signals as a function of each other in x-y. Both input channels are precision balanced for 5% or less phase shift of over 50 kHz. Has switch selected AC/DC coupling; automatic triggering; 18-position time base, 1, 2, 5 from 100 msec/cm-0.2 usec/cm; separate vernier control; 5x magnifier; DC-15 MHz bandwidth with 24 nsec rise time; flat-face CRT with mu-metal shield. The new Heathkit IO-105 expands your capability without stretching the budget, order yours today.

Kit IO-105, 35 lbs. **399.95***

EIMAC conduction cooled 8873s keep Henry Radio's new Ultra Linear amplifier ultra quiet.

Henry Radio beat the blower noise problem by eliminating it. In their quiet, compact, rugged and reliable 2K Ultra Linear Amplifier, anode heat is silently conducted to an efficient heat sink. No more blower. No more blower noise. No more annoying problem.

Two EIMAC conduction cooled, high-mu 8873 power triodes are used in this very linear, state-of-the-art amplifier to provide 2 kW PEP input over the 3.5 to 30.0 MHz range.

Operating in cathode driven service, these tubes typically provide high power gain (greater than 13 decibels) in combination with low, low intermodulation distortion (3d order products better than −35 decibels below one tone of a two-tone test signal). These excellent characteristics of the 8873 may be utilized up to 500 MHz.

With Henry Radio, you know quality counts. And they know you can't do better than EIMAC. For full specifications on the 8873 and its sturdy companions, the 8874 and 8875, write to EIMAC Division of Varian, 301 Industrial Way, San Carlos, California 94070.

STEP UP TO TELREX
Professionally Engineered Antenna Systems

Single transmission line "TRI-BAND® ARRAY"

By the only test that means anything . . . on the air comparison . . . this array continues to outperform all competition . . . and has for two decades. Here's why . . . Telrex uses a unique trap design employing 20 HiQ 7500V ceramic condensers per antenna. Telrex uses 3 optimum-spaced, optimum-tuned reflectors to provide maximum gain and true F/B Tri-band performance.

ONLY TELREX GIVES YOU ALL THESE FEATURES . . .

- Power rating 4 KW PEP . . . rain or shine
- Wind rating survival 110 MPH
- Patented broad-band coaxial Balun
- Heavy-duty steel gusset mounting plate
- Aluminum boom 2 in., 2½ in. O.D. x 18 ft.
- Large diameter, .058 wall taper-swaged dural elements for minimum weight and exceptional strength to weight ratio
- Stainless steel electrical hardware

With a Telrex Tri-band Array you get 49 lbs. of educated aluminum engineered and built to provide many, many years of performance unmatched around the world by any other make. Longest element 36 ft. Turning radius 20 ft. Shipping weight 65 lbs. Shipping container 13 in. x 5 in. x 13 ft.

Note: If not available from your dealer, order direct. You'll get fast, personal service.

Telrex Labs are design engineers, innovators and manufacturers of the world's finest ¾ to 160 meter communication systems and accessories priced from $25 to $25,000.

For technical data and prices on complete Telrex line, write for Catalog PL 70.

OUR READERS SAY

It's Worth The Effort

Editor, *CQ*:

I think this might interest some people on the Novice standpoint about the 13 words a minute code speed. I am now trying for my General, but it took a lot of hard work for me. It did not take too long to get to 10 words a minute, but it takes a hard jump to get to 13 and I think those extra 3 words will prove if you really want to be a ham.

Also, *CQ* is an FB magazine for me.

David C. Winslow, WN4THP
Clearwater, FL

Fond Memories

Editor, *CQ*:

Presently being on temporary duty in Southeast Asia, my only contact with amateur radio has been my monthly copy of *CQ*. After reading the letters to the editor in the October issue a thought came to me which may interest others, especially old timers.

Just as the restrictions on fire arms by the Gun Control Act of 1968 has created a re-newed interest in muzzle loaded weapons and black powder sport shooting. The present feeling that the growth of factory produced rigs leaves little to get excited about in amateur radio could create an interest in building and using rigs such as those used in the days of the SW-3.

Although I won't qualify for the Old Timers Club for another eight years, my first transmitter was built from the plans in a 1938 copy of *How to Become a Radio Amateur*. I have never received as much pleasure from anything I have since built as that first rig when I turned it on, tuned it up, and it worked!

Of course present day technical standards would prohibit the use of some of the older transmitters from the golden years of amateur radio.

I enjoy the advantages of modern communications equipment and techniques as much as any other amateur but a DX contact using 20 watts to a dipole with a regenerative receiver is a change of pace and certainly more sporting than the same contact using 2 kw s.s.b. to a beam 50 feet up.

I have gained a special interest in reading *CQ* these past months, but hope to be home in November, take the rig out of mothballs and have it fired up and on the air again in time for the *CQ* WW DX CW Contest.

Capt. Paul H. Valentino. K4FPF
APO San Francisco

Editor, *CQ*:

Bill Orr's story on the 1934 rig, last issue, seemed like a fair wind blowing through the oppressive electronic jungle that is the current ham game. Through Bill's teasing style one can clearly read his joy in contemplating those days when amateur radio was a participating and not a spectator sport, as in spirit it is today.

In that past wonder-world of which Bill writes, every individual amateur station was an original creation, a genuine expression of each ham's personal ingenuity, not to mention his dreams. Visit an amateur station today and what do you see: "Boxes, little boxes, very technical (and expensive), but all are just the same." Where's the fun in that?

All this leads one to ask: "is change always progress?" If one views amateur radio as basically a *sport*, we seem to have made little gain through all of our growing sophistication. In those wondrous old times we were better shopmen and we probably had a better grasp of theory than most hams have today. We didn't have the big signals then, but we probably enjoyed each QSO more. In fact, we worked as much with 50 watts than as they do with 500 today; we were pretty sure then where each little watt went. Today we have so many watts, we just hook-up, plug-in and let the devil take the leavin's, polluting the whole electronic world for our ego's sake. Is that progress? Vive la decade 1930!

C. F. Rockey, W9SCH
Deerfield, IL

Schematic Skiddoo

Editor, *CQ*:

I'm certainly impressed by your treatment of my old-time transmitter article in the November issue of *CQ* Magazine.

However, let me point out an old-time error in the old-time schematic of Fig. 1. A jumper should be included between coupling capacitor C_6 and the grids of the 46 tubes.

Builders of this equipment who leave this vital connection out will no doubt be surprised when the amplifier stage refuses to work.

And, as they said in 1934, "You can bet your Certified Cremo on that!"

Bill Orr, W6SAI
Menlo Park, CA

Reader George Mickey's letter below is typical of the many fine comments we've received noting the above error. The reader response to Bill's series has been very good and more articles are planned. It is also interesting to note that the classified section is starting to get many ads buying and selling older parts and equipment. For old times sake why not try building something then sit around and watch the tubes light up.

—*Ed*

Editor, *CQ*:

I've read many FB articles by oldtimer W6SAI including *CQ*, November '71, "Build A 50 Watt, 1934-Style Transmitter for Fun!"

You, too, can have a lot of fun if the junction of C_6 and *RFC* is not connected to the grids on both 46's (schematic, p. 18).

Please add this to "Technical Problems," p. 19.

INTRODUCING A NEW SERVICE FOR HAMS

SWAN Revolving Credit Service

As a further service to our amateur friends, Swan now offers a Revolving Credit Plan that permits you to purchase any Swan equipment, and charge it!

If you wish, you can pay your charge each month within 25 days of your billing date with no finance charge. Or if you prefer, you can spread your payments over a number of months, and your monthly payments will be adjusted accordingly depending on your balance.

Now it's easier than ever to purchase Swan equipment. Just order your equipment from the factory, our East Coast branch, or one of our participating dealers, and say, "Charge it!". Once your account has been opened, you can add to your account at any time.

An important fact to remember is that this financing is available directly from Swan. We handle your account from start to finish. Unlike many credit plans offered today, Swan WILL NOT sell your account to some finance company.

Mail the adjacent coupon in today, and we will send you complete information and your Swan Credit Application by return mail, and your account can be opened in just a few days.

Gentlemen:

Please send me:

☐ Complete information on your Revolving Credit Plan.

☐ A Swan Credit Application.

☐ The 1972 Swan Catalog.

The article, however, brought back old memories of the time I took my first commercial FCC exam. They, too, had a schematic with errors which had to be corrected in order to pass.

I wonder how many of your younger readers study each schematic?

George N. Mickey, W9BVK
WLS-TV, ABC Chicago

Announcements

Fresno, California

The 23rd annual California DX Conference will be held on Jan. 22 and 23 at the Del Webb Town House in Fresno. The Southern California DX Club will host the affair. There are many activities planned along with notable DX speakers, plus the grand prize of a Signal/One CX7A as a pre-registration prize. The pre-registration fee of $14.50 should be sent to SCDXC Treasurer Jack Hollander, WB6UDC, 13531 Malena Dr., Tustin, Calif. 92680. Please make your checks payable to the Southern California DX Club and include an SASE if you wish a receipt. You will receive your ticket at the Conference registration desk. Deadline for pre-registration is January 7, 1972; after that date the registration fee will be $16.00.

Stolen Equipment

A Collins KWM-2A radio transceiver, serial number 13815, was recently stolen from an Air Force installation on or about September 2, 1971. Anyone who has any information concerning the location of this radio or any information which could result in recovery of this radio should contact *CQ* magazine, who in turn will relay this information to the USAF.

Goldwater Elected QCWA President

Senator Barry Goldwater has been elected president of the Quarter Century Wireless Association for the 1972-1973 term. QCWA, which was founded in 1947, is a non-profit international organization of radio amateurs who have been licensed for 25 or more years. Current membership is over 5200 of which more than 450 have been licensed for 50 or more years. Other new officers are: Vice President, Harry Gartsman, W6ATC; Treasurer, Mark Devaney, W2NQR; Secretary, A. G. Wentzel, W2HX; Board of Directors: George W. Bailey, W2KH, J. R. David, W4YK, Art Miligan, W8KW, H. H. Robinson, W3RE, Clarence Seid, W2KW.

Liberian LRAA Election

H. Walcott Benjamin, EL2BA, was installed as President of the Liberian Radio Amateur Association (LRAA) at a dinner held on Sept. 24, 1971. He was sworn into office by His Honor James A. A. Pierre, Chief Justice of the Supreme Court of Liberia. Mr. Benjamin is also General Operations Manager for the Mesurado Fishing Company.

Dear_____

Thought you might like to know that I still have plenty of the shaving lotion and talcum left over from last Christmas, I really prefer to pick out my own shirts, and neckties, and what I would really like to have is the Swan equipment I have checked below. OK?

- ☐ Swan Phone Patch, **Model FP-1** . . . . . **$ 44**
- ☐ Swan Desk Microphone, **Model 444** . . . . . **$ 25**
- ☐ Swan Hand Microphone, **Model 404** . . . . . **$ 18**
- ☐ External Crystal Oscillator, **Model 510X** . . . . . **$ 49**
- ☐ VOX Accessory, **Model VX-2** . . . . . **$ 35**
- ☐ I.F. Noise Blanker, **Model NB500** . . **$ 89**
- ☐ Audio Notcher Peaker Accessory, **Model ICAF** . . . . . **$ 59**
- ☐ External VFO, **Model 508** **$129**
- ☐ Mobile Mounting Bracket for mobile installation of Swan Transceivers, **Model MTK** . . . . . **$ 9**
- ☐ Complete power supply for 117 volts 50-60 cps in matching cabinet for Swan's Transceivers, **Model 117-XC** . . . . . **$ 99**
- ☐ Complete 12-14 volt DC Power Supply, **Model 14-117** **$129**
- ☐ DC Converter that converts the 117XC to 12-14 DC operation. **Model 14-C** . . . . . **$ 65**
- ☐ 1200 Watt Linear Amplifier. Has built-in 117 AC power supply. **Model 1200W** **$219**

- ☐ **Swan 500CX,** 550 watt 5 band transceiver **$489**
- ☐ **Swan 270B,** 5 band 260 watt portable transceiver with built-in AC supply and loudspeaker **$429**
- ☐ **Swan 600R,** receiver **$395**
- ☐ **Swan 600T,** 600 watt transmitter for 10-80 meters **$535**

- ☐ 2000 Watt Linear Amplifier. Price includes tubes and power supply. **Mark II** **$599**
- ☐ **FM-2X** two-meter FM Transceiver . . **$259**

- ☐ **VHF-150.** 150 watt 2-meter Amplifier. Built-in 117 volt AC power supply **$279**
- ☐ **14C** DC Converter for VHF 150 . . . **$ 65**
- ☐ Swan 4 element heavy-duty multiband beam antenna. **Model TB-4H** **$129**
- ☐ Our 3 element multiband beam antenna, **TB-3** . . . . . **$ 94**
- ☐ **TB-3H** (heavy-duty) **$109**
- ☐ Two element multiband beam antenna, **Model TB-2** . . . . . **$ 79**
- ☐ High performance trap vertical, **Model 1040V** . . . . . **$ 49**
- ☐ Swan's 5 band Manual Switcher Mobile Antenna, **Model 45** . . . . . **$ 69**
- ☐ 5 band Remote Controlled Switching Mobile Antenna, **Model 55B** . . . . . **$ 99**

This ad can be used as an order blank. Check the items you want, fill in coupon below, and mail to either Swan address. But do it soon to assure delivery before Christmas.

Just one thing. They all buy more pages of advertising in CQ than in any other ham magazine. In fact, more than half the companies listed above will buy more ad pages in CQ this year than in *all the other hams mags combined!*

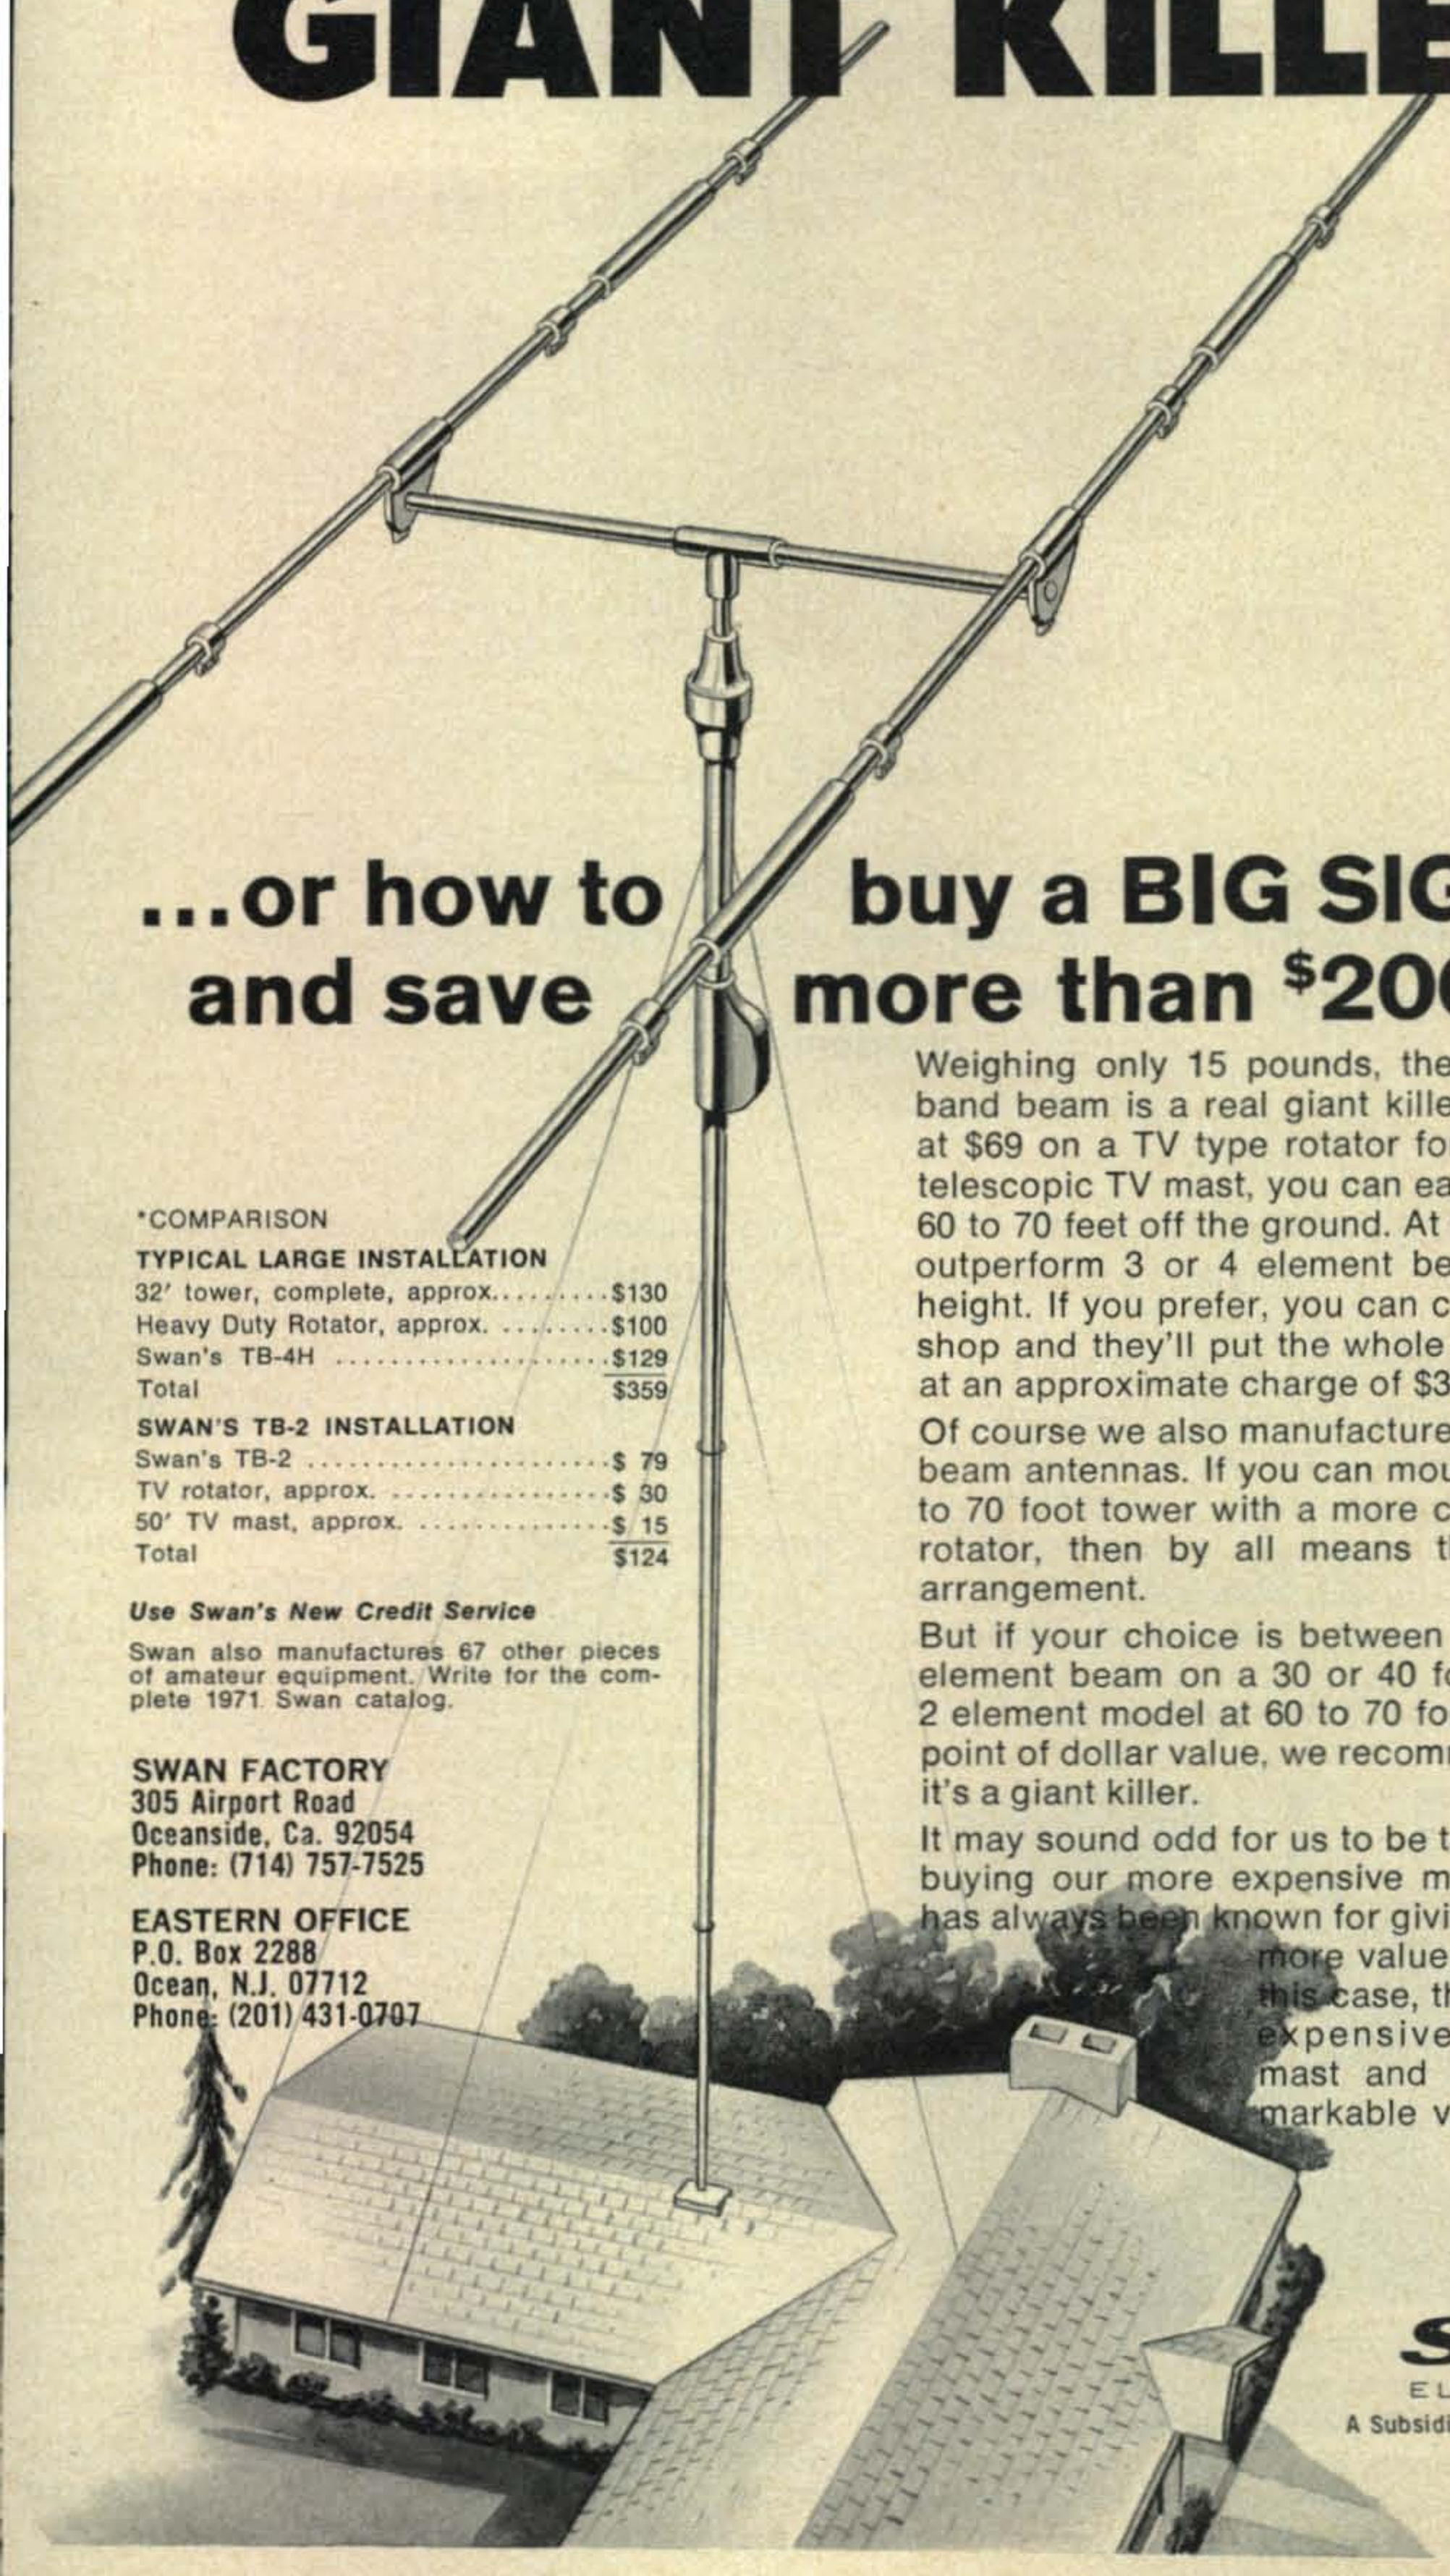
These companies have found over the years that CQ is the best ad buy in the marketplace. And dozens of other companies are beginning to follow the leaders.

SO..

if you want to sell a product or service to your fellow hams, advertise where most of the pros advertise most consistently --

CQ -- the best ad buy in any size budget.

GIANT KILLER



...or how to and save buy a BIG SIGNAL more than $200*

Weighing only 15 pounds, the Swan TB-2 tri-band beam is a real giant killer. With the TB-2 at $69 on a TV type rotator for $30, and a $15 telescopic TV mast, you can easily get the TB-2 60 to 70 feet off the ground. At that height it will outperform 3 or 4 element beams at a lesser height. If you prefer, you can call your local TV shop and they'll put the whole thing up for you at an approximate charge of $30 to $40.

Of course we also manufacture 3 and 4 element beam antennas. If you can mount these on a 60 to 70 foot tower with a more costly heavy duty rotator, then by all means this is the ideal arrangement.

But if your choice is between putting a 3 or 4 element beam on a 30 or 40 foot tower, or the 2 element model at 60 to 70 foot, from a standpoint of dollar value, we recommend the TB-2... it's a giant killer.

It may sound odd for us to be talking you out of buying our more expensive models, but Swan has always been known for giving the radio ham more value for his dollar. In this case, the TB-2 on an inexpensive telescopic TV mast and rotator is a remarkable value.

*COMPARISON

TYPICAL LARGE INSTALLATION

32' tower, complete, approx.	$130
Heavy Duty Rotator, approx.	$100
Swan's TB-4H	$129
Total	$359

SWAN'S TB-2 INSTALLATION

Swan's TB-2	$ 79
TV rotator, approx.	$ 30
50' TV mast, approx.	$ 15
Total	$124

Use Swan's New Credit Service

Swan also manufactures 67 other pieces of amateur equipment. Write for the complete 1971 Swan catalog.

With His Majesty's-President S. E. Don Francisco Macias Ngueman-Cooperation or How Annobon Was Activated

BY MARTIN LAINE,* OH2BH

Probably the most successful DXpedition in amateur DX history, the Annobón trip is the big one that very nearly didn't happen. Here is the story of this long-awaited new country, and of the men who made it happen.

THE island of Annobón in the South Atlantic has captured the thoughts of radio amateurs for years, and because of the location of the island she manifold fulfills the DXCC requirements. Time and again, Don, Gus and many others strove to render possible the first DX-pedition, but in vain . . . Annobón and Fernando Poó islands, together with Rio Muni on the mainland, were part of the Spanish colonies until 1968. With General Franco's compliant help these dominions became independent in October 1968 and presently constitute Equatorial Guinea. This incident was also noted by radio amateurs and facilitated Annobón plans, which thus far had always met with the refusal of the administration of Spain, prohibiting even the Spanish from operating in their own colonies. The road was paved for a new country, a country which breathes independence, but is obviously aware of the problems involved especially due to lack of export goods.

Who would engage in "meeting the big chiefs?" They might well be friendlier than the colonial officers. The OH-gang took up the job, sweated through and succeeded! A new DXCC country number 323 on the country list. Was it easy? Surely not . . .

*Paatsamatie 5A12, 00320 Helsinki 32, Finland.

Ville, OH2MM, operating in Annobón. The pile-up was huge—sometimes we were clearing it at a speed of almost 300 QSO's an hour. He couldn't even enjoy the bottle on the table—it was Spanish water, we carried 5 gallons of it all the way to Annobón, 620 miles.

Preparations for the Trek

Our preliminary concerns were already discussed during the latter part of 1970; OH2NB made contact with some of his "useful" Spanish acquaintances. We sent applications for visas in the very beginning of 1971 explaining that the purpose of the trip was to make a radio amateur operation, the first since the country's independence. The one and only Embassy of the country, in Madrid, answered and requested reasons for making the trip.

Reasons for reasons! We found out that the senóres legation officials hadn't dwelt on their English homework and so the papers were submitted in Spanish. The answer we received was next to hilarious (the typewriter lacked letters and was apparently falling apart), but promised us the visas well before our departure; which was due in four months. Week after week slipped past and no answer. A few weeks before the planned date of departure we set up a soon-to-Annobón scheme to do our utmost to realize the trip. The Embassy was flooded with letters of recommendation and inquiries—our representative in Spain visited the Embassy daily. At times it seemed that this must be the first real problem facing Equatorial Guinea during her young independence. Manana—manana and the set date was passed. We certainly wouldn't give up, so OH2NB and OH2BH flew to Madrid to personally take the bull by the horns. The visas had been promised—why not issued?

Often we sat for periods of four hours in the Embassy waiting room without progress! It took the Finnish Embassy to wake up the Guineans. Our ambassador went to work on the problem and finally things were in order. The timid Guinean secretary of the legation wrote us tourist visas numbers 6 and 7, but wouldn't take any responsibility for the radio operation. Nevertheless the visas had been issued knowing the purpose of our trip—we were sure to give it a good try. OH2MM had made it in time to Spain with the radio gear and got his visa and vaccinations, now we could buy tickets. We bid OH2NB farewell at a cocktail party arranged by our Embassy and he returned home having succeeded in person in making the arrangements which previously had been holding everything up.

Goodbye Europe

In Spain we still ran into many complications, which were brilliantly solved with the help of EA4LH and EA4JL. They were real ham-spirited fellows, the least to say.

June 20th, a sunny and beautiful day—our final day of departure. We hopped aboard an Iberian DC-8, which was to take us to Fernando Poó, 3C-country. The plane took off after a long delay and flew over North Africa and finally after six hours reached Santa Isabella's short runway. Our feelings were mixed as we knew nothing of what lay ahead. We had experienced much during the past

Fernando Poó, an island ten miles in length, faces Cameroun near the coast of Africa. Equatorial Guinea consists of three parts; Fernando Poó is the administrative center with the capital Santa Isabel which is a clean and idyllic city—it has everything you can think of. The high-standard Hotel Bahia at the edge of the city provides lodgings for all foreign visitors.

years and expeditions but this was new and exciting. The climate was sultry and damp and as beginners we soon were soaked through. It was the rainy season in the area but we could see no trace of refreshing rain. Having filled out several entry papers we were finally facing the customs officials. That inspection should have made me fly home instantly—too late, ten officials searching through the smallest trifles. Our papers seemed to be of interest and the bitter truth is that they confiscated all of them. Damn it! . . .

The President's palace in the center of the city is a stately building. Even the pathways in the park showing in the foreground are paved with mosaic. The roads surrounding the building are all closed and the palace is heavily guarded from all sides. The DX-peditioners went through a thorough body-search nine times and towards the end were granted admittance without a special reason. The President was indeed friendly towards the tourists numbered 6 and 7.

After a successful landing on Annobón we had to suck fuel from the fuel-bin of the plane. It took two hours and during this time our flight captain gulped at least two dozen "fuel grogs." 20 gallons was enough for a week. In the front the Commandant is keenly observing.

we need the papers, where will they accept hand waving in place of credentials? "The President will look at the papers and they will be returned to you tomorrow morning," one of the customs officials muttered. What's that? The President? Must be strict fellow that President . . .

Santa Isabel and the Seven Days of Work

Our hotel was in the beautiful and idyllic city of Santa Isabel. The only hotel on the island, the Spanish-styled Hotel Bahia was very cozy. One of the services of Bahia was a restaurant under the shade of palm trees near the seashore. We went to our top-floor room and fell asleep completely exhausted. What about our radio equipment? Well, we didn't even dare think about that after such a customs inspection; we left the gear at the airport for better days to come. Next morning we waited for our papers—but nothing happened. Something had to be done, we decided to sound out the situation. The next flight to Europe was due after a week and the whole world was waiting for us to be on the air. Incidentally, are we leaving on that flight—or any flight for that matter?—Forgive me, but my thoughts keep returning to those days.

By mere chance we discovered the American Embassy. That's it—the yanks have always been our friends! Mr. Alfred Erdos, the chargé d'affairs welcomed us cordially and took us in. We explained the situation to him and our sincere intentions but . . . before we had finished the sentence he almost blew up. "Did I get it correct? Radio contacts from here? Act as if you were never born and scram out of here on the next plane, that is if you'll be able to . . . here the police check telegrams, letters are left unsealed to the Post Office and every foreigner is followed . . . you must be *insane!*" He certainly was not of much help. "Good bye."

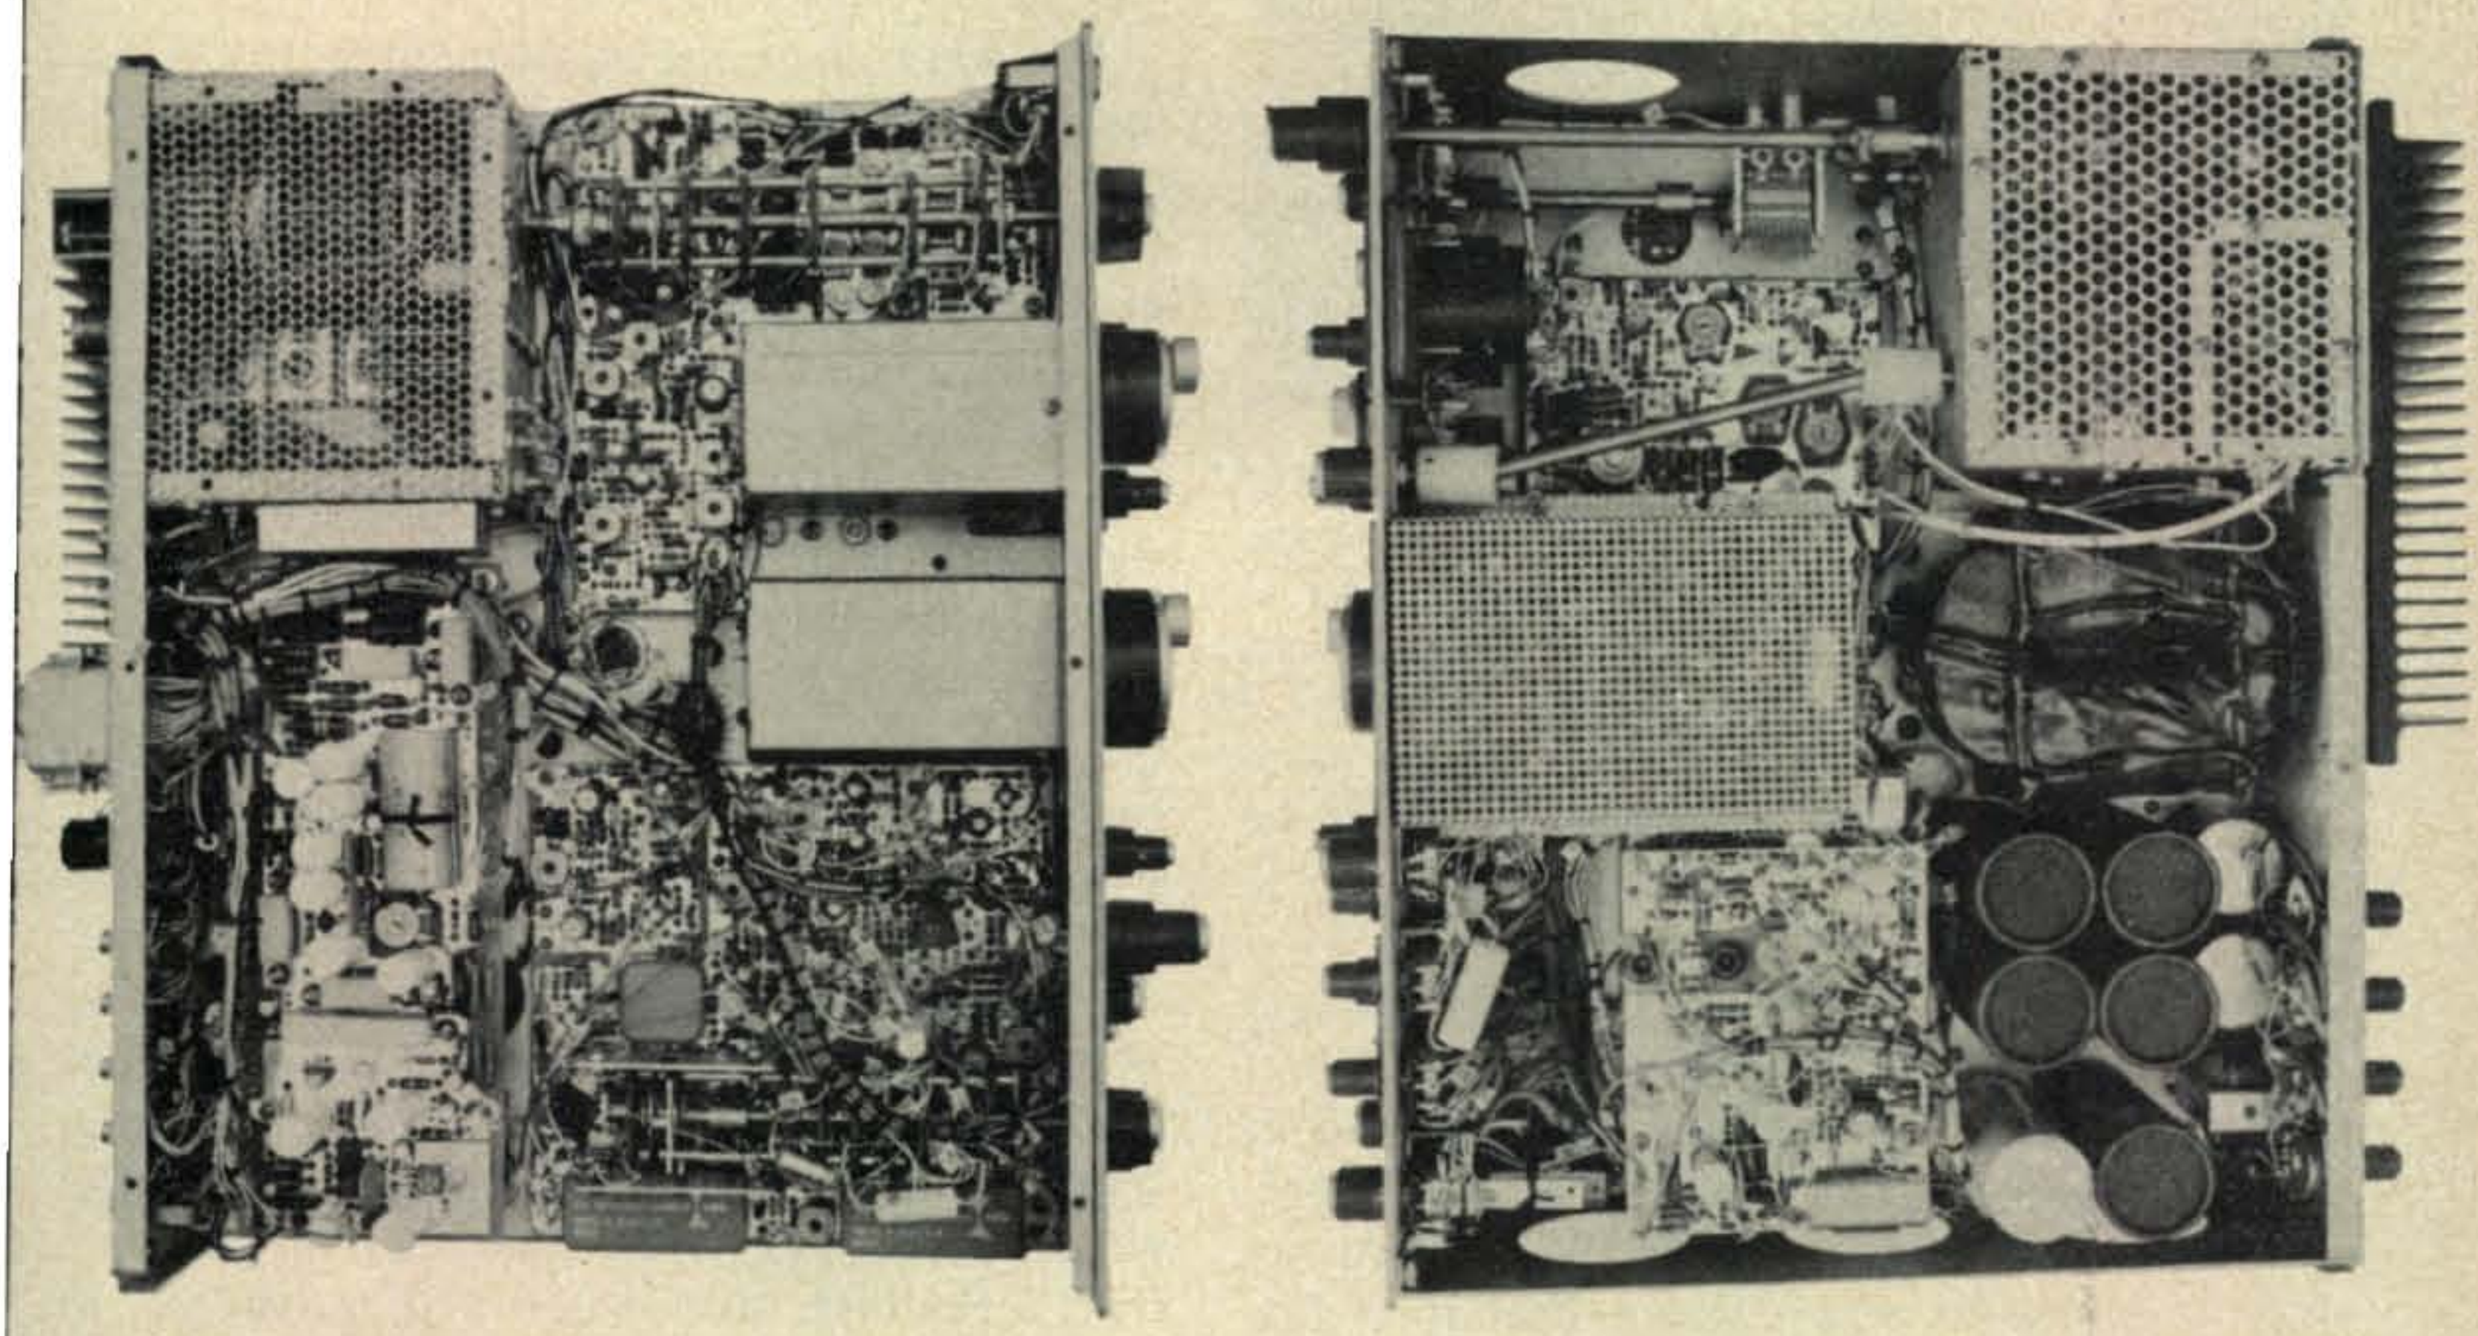
In course of the discussion we learned the names of two Swedes and sought them immediately. They were working for the ITU, training the locals. Next morning we headed for the Ministry of Home Affairs with the Swedes. The Chief of Department Sr. Pale-Pale received us and listened patiently. Our discussion lasted only a short moment, the decision making was even quicker—Pale-Pale's convincing "no" was so vehement that it grounded us at once. The DX-pedition was over. We decided to concentrate in getting out of the country.

Not quite—this was just the beginning. While strolling down the beautiful streets of Santa Isabel an Army Land Rover pulled over beside us and three militia jumped out. They waved us into the car. Will this mean a violent and sad end to the story? The events of last year's New Year's celebration in Santa Isabel flashed through our minds. According to the Swedes three white people had been sacrificed to gods in a big stadium. We reckoned they had already two for the next feast. But the militia only went for an interpreter and drove us to our hotel. The interpreter forwarded us the President's warm regards and wishes for a pleasant vacation as well as all our papers. The militia shook hands in a good mood and left.

What was to be our next move as the President seemed to have forgotten the radio business? We hastily composed a letter to the President and took it to the President's palace. We were directed into a waiting room after a body-search; two hours of waiting as becomes the African spirit and eventually the Protocol Chief received us. We delivered our letter with enclosures and returned to the hotel looking forward to the President's answer. On our way back we dropped in at the airline company's cargo station and noticed our equipment was unpacked in a storage room. We had arrived four days ago and seemingly the days were becoming more and more exciting.

On Wednesday we got things going. We received an invitation to arrive immediately

We built every imaginable feature into the CX7A.



Including reliability.

The CX7A was designed as the amateur's ultimate rig and every conceivable feature you could want was incorporated.

As you can imagine, this design resulted in some pretty complicated circuitry. And at first there were bugs. There always are when you're treading new paths.

Some of the first sets did their job so enthusiastically they went right up in smoke. So we went over the problems with a fine-toothed comb. We learned a lot, and we did something about it.

Now we buy only the finest components obtainable. And we check each component individually. Every resistor, every semiconductor, every whatever, is "burnt-in" before it's put in.

So now when you crank up a CX7A it'll smoke all right — with the heaviest talk power and most sensitive receiver of any rig you can buy. And you can rely on that. For it, you pay $2,195.

See the CX7A at your signal/one dealer. Or write us for a detailed brochure about it. Then buy one. You'll be the most reliable operator in town.

The volcanic island of Annobón is about four and a half by two and a half miles in size. The village of San Antonio is located in the southern part of the island and virtually all of the 1436 inhabitants live there. Fishing, the main source of livelihood is done from canoes carved out of a single piece of wood. The climate of the island is told to be the healthiest in the world.

to the President's palace. After a few obligatory hours of waiting the Protocol Chief announced that the President had granted us a radio-amateur permit which we could collect the following morning. We spent an uneasy night—it was evident that in a few hours we should get into something. To the President's palace once more in the morning; this time we received a permit beginning with the words of the title of this article. The permit also promised us all the help and cooperation which would be required to carry out an operation of this kind in Santa Isabel and Annobón. In addition to this we were asked to visit or "report ourselves" at the local Telecoms office and the Ministry of Home Affairs where the formerly mentioned Sr. Pale-Pale was sorry for his naughty words and now greeted us with a big smile. Thus a valuable day had slipped by once again. It took us all Friday to explain about our equipment and amateur procedures to Sr. Mateus, the Chief of Department at the Telecoms office. Mateus probably hadn't heard before that ITU had granted independent Guinea a 3C-callsign. Mateus was eager, however, to approve of the callsign—as requested by the President—and was even speculating on the next callsign. The customs had a day off on Fridays so we agreed to meet Mateus the following morning when we could call for the equipment. Mateus expressed his regret that we would be unable to contact other amateurs on the island as there were none; and surely our 200 watts would never reach the mainland of Africa. They hadn't had much success with their own 5 kw BC station on longer distances. Let's leave Sr. Mateus alone: he's only a novice in radio amateuring.

3C1EG and 7500 Contacts

We were given the equipment in the morning without any problems and brought it to our hotel room. Operation began and Hotel Bahia soon turned into Radio Bahia as expressed by the manageress of the hotel. The equipment had endured the trip undamaged and was performing superbly. The dipoles on top of a 33-foot shining mast were sending S9 signals all over the world. Equatorial Guinea is an exceedingly rare country and consequently there was a huge pile-up. Amidst all the high activity we constantly kept in mind the ultimate purpose of our trip: Annobón was our goal as the 1.5 kw generator in the corner of our room kept reminding us.

We visited the harbour every day inquiring about a ship that might take us the 450 miles to Annobón. The results were discouraging, there were only a few fishing vessels in the country and they were in constant use. We met a Spanish shipowner who promised to help if we waited for two months; at that time he was too busy with the fishing season at its best. We met him almost every night and stuffed him with our questions and requests. Before long we were able to change our friend's mind and so we had the ship. Three days to Annobón, two there and three on the way back; the price tag of a voyage on a 20-ton vessel including a six-man crew: $2200 and no chance for bargaining anyway. This was a deal and now we could imagine ourselves at the shores of Annobón. Next day we went to the Ministry of Maritime Affairs to arrange the necessary papers. The departure was certain and already at the docks we were sketching the installation of the MM-antenna. In the meantime the pile-up at Radio Bahia would be continuing for another three days until our departure.

Next day brought with it one of the big back-lashes of the trip—our friend, the owner of the ship told us the deal was off. We were told that he had been threatened with his life not to go tourist-sailing and give up fishing, which is so necessary for the country's economy. Our friend was afraid because so many of his countrymen had been exiled for similar attempts. He was sorry, but firm.

We informed the gang that we'd have to

give up Annobón for this had been our last hope. We felt the world was sharing our grief and many expressed their concern. But not all merely grieved and something unpredictable occurred. The DX world showed its unity and vast resources by finding our transport over the sea to this remote island south of the Equator. There was plenty of effort by Eva, PY2PE of Brazil. She studied several possibilities to reach Annobón from Douala in Cameroun or Librevillé in Gabon. The choices were many and Eva had tangled the Ambassadors and consuls of these countries for the cause. The owner of an 300-foot fishing vessel sailing nearabouts was contacted at Puerto Rico and he agreed, only the price was such that Ville and I doubted the place of the decimal point. Robert, TY1ABE, from Dahomey solved the problem: an army Cessna will pick up the boys from Santa Isabel and fly to Annobón—$1900 and a weeks flying secured. But, mind you, how? There's no airfield on Annobón. The only recorded landing was by a small plane four years ago. . .

Farewell Santa Isabel—Mission Annobon

We'd gamble once more—on Monday we were waiting for the Cessna at the airport. We had inquired about the runway of Annobón but almost everybody insisted that there was none, they had all witnessed it themselves.

The plane flew from Dahomey to Santa Isabel and landed as notified beforehand. We were greeted by two cheerful African pilots. Everything was okay and we were ready to start —runway or no runway. Radio amateurs from the other side of the world had arranged for the plane to fly to the island—hardly even knowing where it was so who were we to argue. The pilots were ready to make an effort, they were army pilots at that. They were clearing the red tape while we were loading the small 4-seat plane with our gear. Then the pilots interrupted us to tell us the game's over. No permit would be issued because there's no runway. The chief of the airport wouldn't take responsibility for a flight to an island without a runway. They also told us it is prohibited to land on Sao Thome (CR5), halfway, because the relations of the countries are completely broken off. If we landed on Sao Thome we'd have to keep out of Guinea afterwards. A flight directly to Annobón was out of question as well, in case landing was impossible our fuel wouldn't take us

A snow-white beach surrounds the village of San Antonio. The blue waves of the Atlantic caress the shores of Annobón. The people are friendly and happy. They know what is happening elsewhere but want no part of it. They want to live on their own beautiful island which the encyclopedia described as the only paradise on earth.

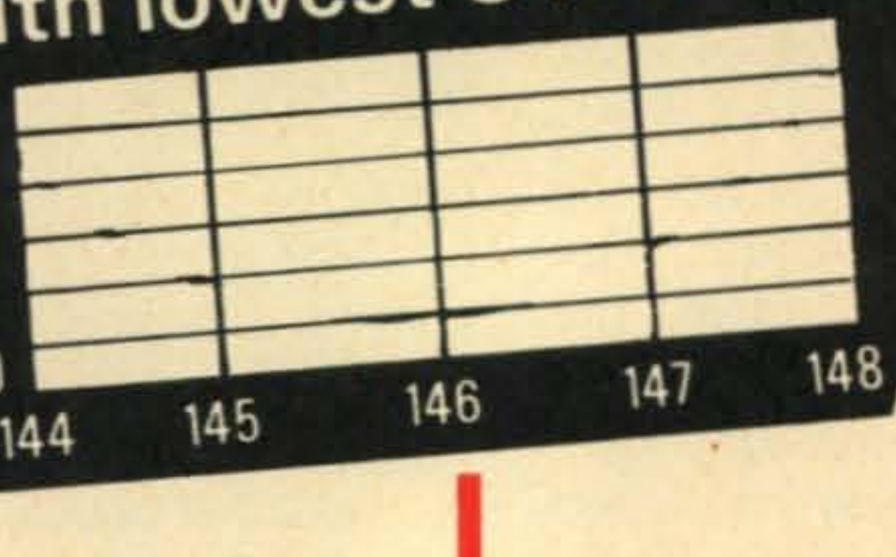
back. This time as before we relied on the method so suitable in this country. All of us, the pilots, airport officials and radio amateurs into the Land Rover and off to see the President—we could always count on him, and rightly so. The plan soon read: first to Librevillé, the capital of Gabon (TR8) where we could fill up with fuel and from there fly 290 miles to Annobón. They didn't know anything about the possible runway at the President's palace either, so we suited ourselves with this solution. This was our ninth visit to the Presiden's palace. Just before dusk we took off and flew in bad weather towards Librevillé, a very European-like city and very expensive. The prices were quadruple compared to those at home. Fresh and expectant we were ready for this century's number one flight waiting at the Librevillé air terminal. This Thursday morning at the beginning of our fourth week we were thinking of Annobón, DXCC country no. 323, forlorn in the swelling and roaring southern Atlantic.

Welcome to Annobon — An Island of Paradise

We left mainland Africa behind us and made our way over the sea. Our only means of navigation was a compass as we flew above the clouds to maintain the minimal altitude. After two hours we dived near sea level observing possible landmarks. Onwards and onwards— no sign of Annobón. At last Lt. Tognisso said: "She could be behind those clouds in front of us." He was right, there was the island covered with dense fog. We reduced

with HUSTLER VHF mobiles

you can be sure of OPTIMUM GAIN with lowest SWR . . .



to push your signal MILES more...

6 & 2 METER MOBILE

Heavy duty, precision fit, four section telescopic antenna tunable separately for combined six and two meter operation. Extends to 44". Collapses to 22".

Model HF-2: Antenna supplied with ⅜"-24 base to fit any standard antenna mount. **$9.50**

Model HF-62: Supplied with automotive eight ball base for fender or cowl mounting. Includes 60" RG-58-U and connectors. **$11.95**

HF-62 HF-2

Tops in Rooftops

140-500 MHz— UHF/VHF Antenna

Low profile, roof top with factory attached cable—installs from outside without disturbing car header. 17-7 PH stainless radiating element—field trimmed for frequencies between 140 and 500 MHz. Complete with 15' RG-58-U coaxial cable.

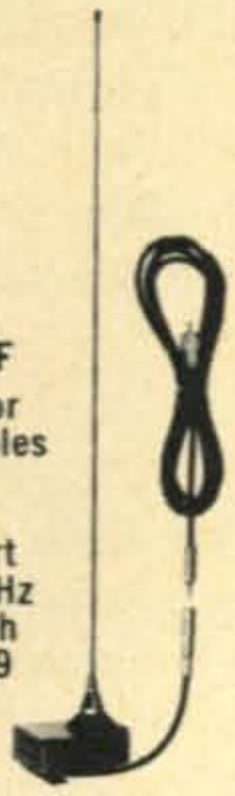
Model UHT-1
$7.75

Trunk Lip Mount

140-500 MHz UHF/VHF

Easy to install on side or rear of trunk lip. No holes to drill or coax to trim. 17-7 PH stainless steel radiating element. Chart included for 140-500 MHz coverage. Complete with 17' RG-58-U and PL-259

Model THF
$12.95



NEW!

2 METER POWER GAIN

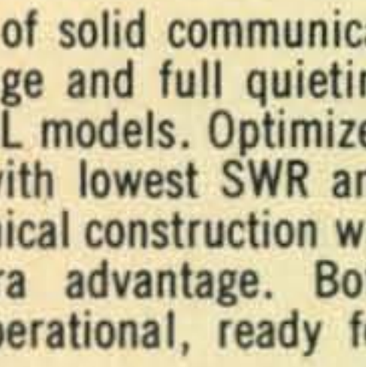
143-149 MHz
3.4 db gain—⅝ wavelength
Power rating: 200 watts FM

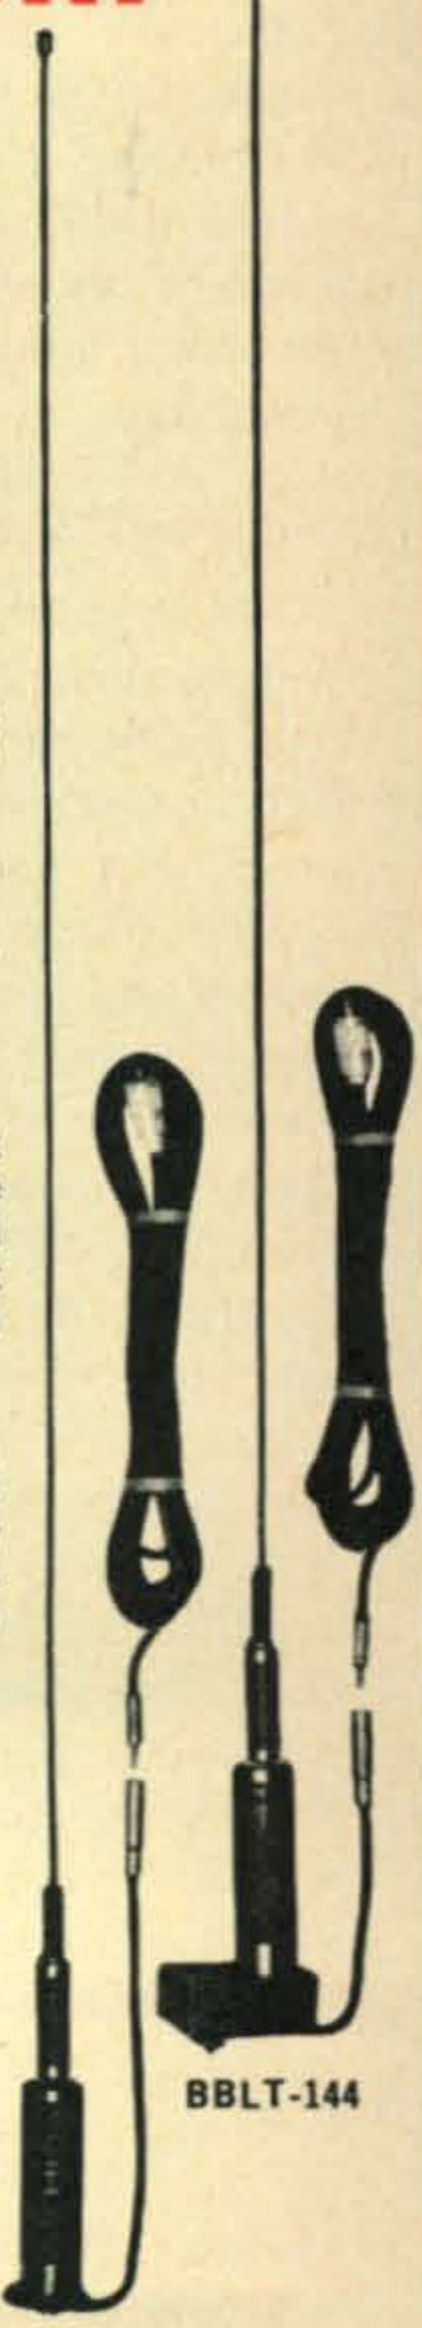
Get the experience of solid communications, extended range and full quieting with the Hustler BBL models. Optimized gain performance with lowest SWR and the superior mechanical construction will give you the extra advantage. Both models supplied operational, ready for easy installation.

Model BBL-144: Mounts on any flat surface in ¼" hole—easy installation on roof, (without pulling cars' header), deck or fender—complete with adjustable, taper ground stainless steel radiator, stainless steel spring. Overall height approximately 47", 17' RG-58-U coax with PL-259 connector. **$27.70**

Model BBLT-144: Same as BBL-144 with Hustler trunk lip mount for no holes to drill installation on side or rear of trunk lip. Heavy duty mount assures "stay-put" operation, positive RF ground for lowest SWR and completely hidden cable. **$34.70**

Exclusive Hustler "break cable" assembly for simplest installation of all!





BBL-144 BBLT-144

altitude and approached the northern tip of the island, flew over the village and its peculiar-looking huts but couldn't make out any runway. "Right there, below us—there's the airfield covered with bushes and scrubs," Tognisso cried out. "Let's go down," were his words before diving. I was fervently praying . . . the plane was swallowed by the vegetation . . . I was scared to death . . . the wheels met the ground. Several-feet-high bushes were pushed aside as our Cessna 337 kept tearing through the jungle like a thick-skinned machine. There were neither stones nor ditches and we halted in the middle of the bushes with tufts of grass stuck to the wheels. Lt. Tognisso and Capt. Ayossa shouted like winners of a state lottery: "We did it, the army of Dahomey did it." We weren't left out of the slapping and celebration although we were in back of the plane stiff with fright. The "airfield" was soon crowded with people. It seemed as if all the 1400 inhabitants were present. They wouldn't come too near but jammed in a crowd about a 100 yards away. A man with a uniform stepped out of the crowd and slowly walked towards us. He turned out to be the Commandant of the island. He welcomed us and told us that we were the first white men on the island for four years—the very first since the country's independence. He also told that the President had sent him a wireless message telling of our arrival. The Commandant was sorry that the runway hadn't been cleared but had planned to start clearing it the following day. The people grew braver and edged their way around the plane. The children had never seen such odd-coloured men and the plane was worth reconnoitering as well. Finally a mile-long queue started out towards the village. The two white men were guests recommended by the President and therefore weren't even let carry their own bags. We threw a glance to see the plane take off also expecting it back in four days. Full speed through the bushes again. It barely rose up at the edge of the "runway." The plane saluted us with a pass overhead and waved its wings before leaving. The takeoff was such a narrow escape that it wouldn't bear four of us with all the equipment—take-off friction and loss of acceleration due to vegetation makes it impossible.

We cast aside the problems of the future, the beginning of the DX-pedition was so near. We walked some two miles to the village

This mast was a product of the island. It helped us to push the signals to JA and ZL behind the 3000-feet-high three-tipped mountain ridge. We are sorry, but we couldn't have possibly managed the beam with us.

where we were shown our quarters. A good stone building at the other side of the village. The house was built especially for guests of the island—only there hadn't been any for years. A recently reconditioned living-room, a kitchen with gas and a refrigerator, a bedroom for both of us and on top of all this luxury a bathroom with running water . . . Whoever told stories about savage natives, we can't agree—the natives were thoughtful hospitable people who knew the word luxury although they lived in grass huts themselves. The house has electricity—where's the end? we got 220 volts 50 Hz three hours a day. There was enough oil for the generator for a few weeks more, after which the island would be met by total darkness.

Up with the antennas and get our own

This team explores the world ignoring the distances and the expenditures when a good DX-pedition is at stake, e.g., to the island of Annobón in the South Atlantic. What is their next destination? From left to right: Ville, OH2MM, Armas, OH2NB and Martin OH2BH—they are the ones who know.

generator gonig! 3CØAN is in ether after years of waiting. Bill, W3RX, got the first QSO while the dipole was only about 5 feet high. The pile-up was immense . . . G5AFA, the first one from Europe, VE3ACD from Canada—the world was falling on us. We quit for a moment to lift the antenna—the nosiest had been r.f.'d on their fingers and were on the alert. During the first few days natives gathered around our house but soon got used to our strange bustling and accepted us as part of the island. Victor, the radio-operator of the island, spent much of his time with us—practiced with the el-bug and even chatted with the Spanish on s.s.b. The 84-year-old priest came to see us and asked us to forward a letter to his colleague in Santa Isabel. All told we got about 60 letters to take back with us. We thought our sun-glasses and watches would furthermore broaden the understanding between the islanders and us. The Commandant of the island nowadays boasts with OH2MM's watch—it's all for amateur radio you know?

The operation went on non-stop except for a pause for fueling the generator once an hour. Conditions were excellent—24 hours a day and we hardly had time to open our few food cans. We were operating full capacity to make everyone happy around the world.

Friday dawned, the plane was supposed to return that day. It did and landed beautifully on Annobón's *airfield*: 500 women (men don't work on the island) had spent four days clearing the field. In return the pilots brought batteries and tobacco for the islanders. Visiting the village that evening we found out they had found good use for the batteries, music was playing in every hut. The village formed a touching sight against the tranquil surface of the Atlantic. Saturday morning was sad, we left our true friends, the magnificent village of Annobón, its rugged mountains, white beach and magnificent climate. We left the people on their own island of paradise. The people were waving as the odd-coloured strangers bid farewell to Annobón, always treasuring the pleasant and plentiful memories of the island.

From Librevillé we flew to Santa Isabel the same evening where we spent our last Africa-evening with our pilot-chums, we were all equally happy about the success. Next morning we had to take leave of the pilots as well

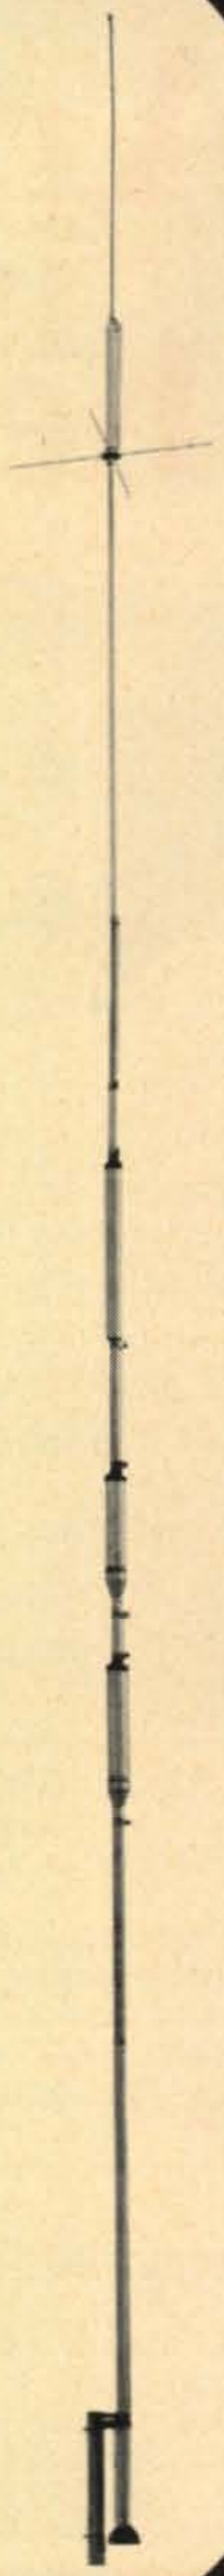
The most powerful antennas under the sun!

NEW

NOW... A GREAT NEW WIDE BAND VERTICAL for 80 through 10 Meters

HY-GAIN'S 18AVT/WB



Take the wide band, omni-directional performance of Hy-Gain's famous 14AVQ / WB, add 80 meter capability plus extra-heavy duty construction—and you have the unrivalled new 18AVT/WB. In other words, you have quite an antenna.

- Automatic switching, five band capability is accomplished through the use of three beefed-up Hy-Q traps (featuring large diameter coils that develop an exceptionally favorable L/C ratio).
- Top loading coil.
- Across-the-band performance with just one furnished setting for each band (10 through 40).
- True 1/4 wave resonance on all bands.
- SWR of 2:1 or less at band edges.
- Radiation pattern has an outstandingly low angle whether roof top or ground mounted.

CONSTRUCTION...of extra-heavy duty tapered swaged seamless aluminum tubing with full circumference, corrosion resistant compression clamps at slotted tubing joints...is so rugged and rigid that, although the antenna is 25′ in height, it can be mounted without guy wires, using a 12″ double grip mast bracket, with recessed coax connecter.

the Argonaut is here!

the go anywhere do anything rig.

The Argonaut
is for every ham.
A transceiver that operates
on an AC pack or lantern battery.
Covers Amateur bands 80-10, SSB and CW.

A little bored with high power? Substitute skill for brute force and thrill to the challenge of conquering distance with a few but potent watts.

Operate the Argonaut anywhere. Slip it into a suitcase when traveling (it occupies less than 1/5 cubic foot). Enjoy it in a motel, campgrounds, on the beach or patio, or carry it as a backpack when hiking.

Sailing? Tie down the mainsheet and enjoy a QSO. Flying? Keep in contact with the world. Motoring in a car, camper or trailer? Go mobile without tedious installation.

The Argonaut is more than just fun. It is always ready for the serious business of providing emergency communication when commercial power fails. It augments one of the great public services of Amateur Radio.

The Argonaut is for every ham.

The Argonaut is for *you*.

Argonaut Price	**$288.00**
AC Power Supply	**$ 24.95**
Microphone, EV PTT	**$ 17.00**

SPECIFICATIONS

GENERAL: Frequency range in MHz: 3.5 - 4.0, 7.0-7.5, 14.0-14.5, 21.0-21.5, 28.0-30.0. 9 MHz crystal filter. 2.5 kHz bandwidth 1.7 shape factor at 6/50 dB. Automatic sideband selection, reversible. Completely solid state. All circuits permeability tuned. Tuning rate approximately 25 kHz per revolution. Size: HWD 4½" x 13" x 7". Weight approximately 5 lbs.

RECEIVER: Sensitivity less than ½ uv for 10 dB S + N/N. Backlash less than 50 Hz. S - meter. AGC fast attack, slow delay. CW side tone. Incremental tuning. Separate af and rf gain controls. Frequency response 300-3000 Hz. Distortion less than 2%. Built-in speaker. Drift less than 100 Hz. Dial accuracy ±5 kHz (slightly more in 28 MHz).

TRANSMITTER: Power input: 5 watts PEP SSB, 5 watts CW. Output circuit: broad band 50-75 ohm impedance. Actuation: Press-to-talk. Full break-in for CW. Built-in SWR bridge. Integral TVI filter. Drift less than 100 Hz.

☐ TEN-TEC dealers have Argonauts in stock. If there is no dealer in your area, order direct and include $2.00 for shipping. Tennessee residents, add 3½% sales tax).

CQ Reviews: The Sonar FM-3601 2 Meter FM Transceiver

BY GLEN E. ZOOK,* K9STH

ANOTHER communications manufacturer has jumped into the amateur f.m. market with both feet. Namely, Sonar Radio Corporation of Marine communications fame. Sonar's contribution to f.m. is the FM-3601, a solid state, 10 watt output, 8 channel, unit with dual-conversion and narrowband standards. The FM-3601 is an outgrowth of their marine model 1803. The unit comes from Sonar with crystals for 146.34/146.94 MHz and 146.94/146.94 MHz. Other crystals are available. The unit may be operated from 12 v.d.c. negative ground or from 117 v.a.c. with the PS-2923 optional power supply. Front panel controls include microphone jack (mic included), squelch control, off-on-volume control, and transmit and power pilot lamps. The front panel is an attractive wood grained finish with black and chrome trim.

Technical Details

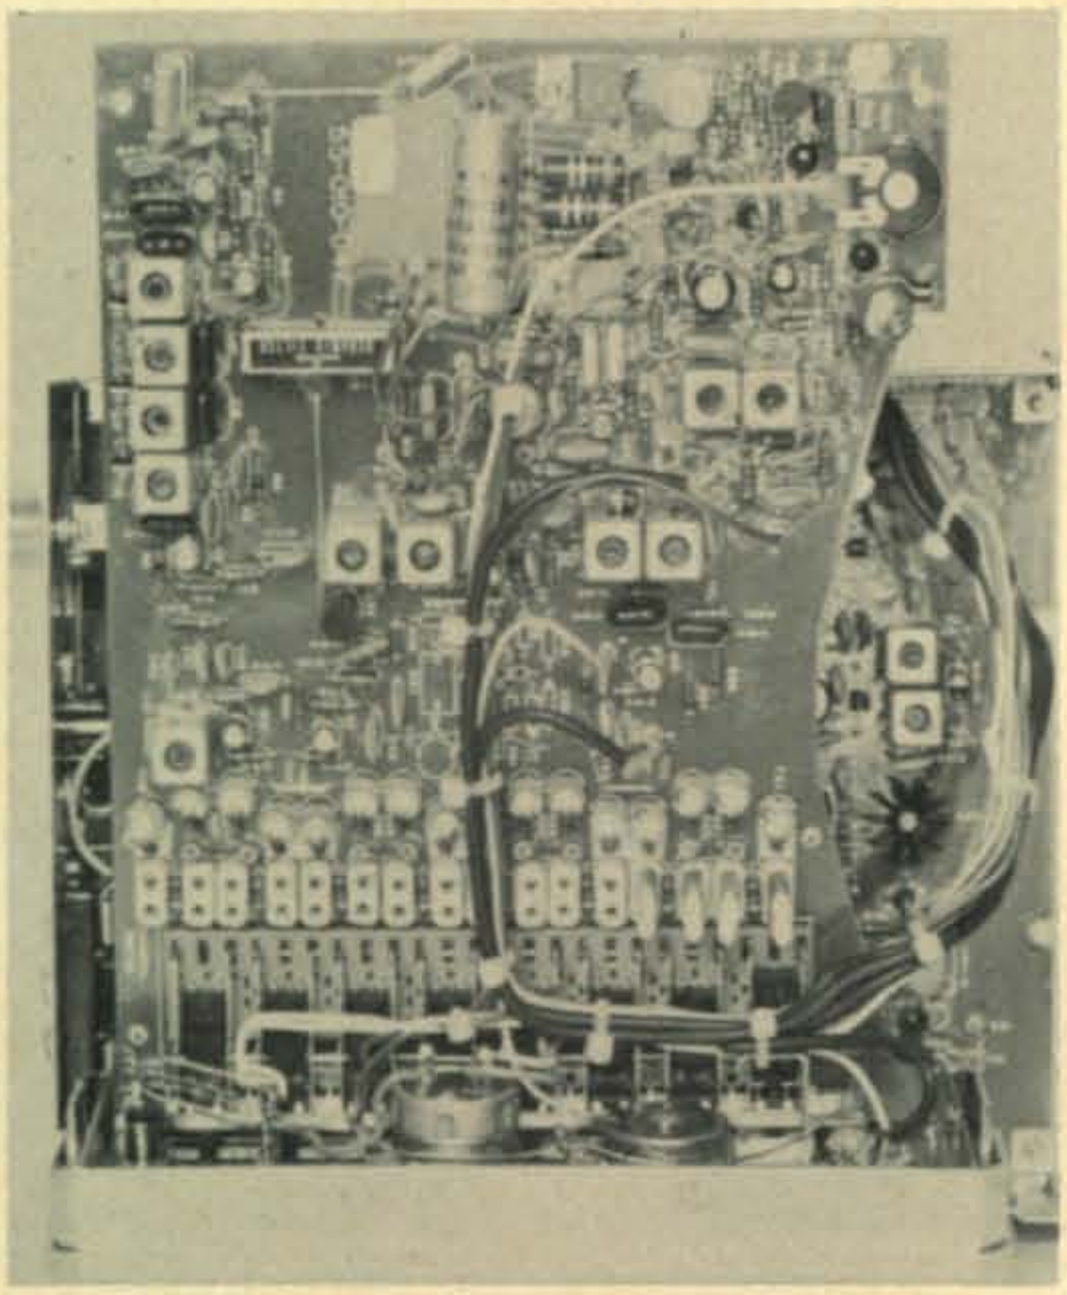
The Sonar FM-3601 is fully solid-state. Channel selection is with eight push buttons on the front of the unit. External speaker connections are on the rear of the unit as is the 12 v.d.c. power connector. Construction is on excellent G-10 epoxy boards.

TRANSMITTER: The transmitting section of the FM-3601 is fully solid state using 12 MHz crystals in an eight-channel circuit. Each crystal is provided with a separate trimmer capacitor for adjustment to desired operating frequency. Frequency multiplication is twelve times which is accomplished in seven stages including oscillator and driver and final. Modulation is phase type which is accomplished using limited and filtered audio. The audio stages are an audio amplifier transistor, diode limiter circuit, and a two-transistor "roll-off filter" circuit. The microphone is controlled magnetic with a 1500 ohm impedance. The transmitter does not incorporate a high reflected power sensing circuit as do some other solid state amateur f.m. units. However, the final transistor is de-rated enough to be able to dissipate the power should a shorted or open antenna occur. A low pass filter and antenna change-over relay complete the transmitter section.

RECEIVER: The receiving portion of the Sonar FM-3601 is a fully solid state, dual conversion (10.7 MHz and 455 kHz i.f.'s), 8 channel circuit. The front-end transistor is an RCA 40235 bi-polar and the first mixer is an RCA 40673 dual-gate IGFET. There are four tuned circuits between the first and second mixer with no amplification taking place at 10.7 MHz. First mixer injection is provided by a two transistor oscillator multiplier (× 3) circuit using 45 MHz crystals. Each crystal has an individual trimmer for on frequency operation. An 11.155 MHz signal is provided from the second oscillator to the second mixer (bi-polar). The resulting 455 kHz signal is passed through a ceramic filter for selectivity into an RCA CA3076 integrated circuit. In the IC limiting and amplification takes place. The processed 455 kHz signal is then fed into a transistor amplification stage and applied to the discriminator. The audio section, consisting of an emitter follower for matching, differential amplifier (2 transistors), driver, and complementary audio out-

*FM Editor, *CQ*.

The Sonar FM-3601 is a solid state, 10w. class, 2 meter f.m. transceiver. This eight channel unit is housed in an attractive woodgrained metal cabinet.



The FM-3601 splits into 2 portions for service. Note the position of the crystals and trimmer capacitors. The boards are epoxy with very good workmanship.

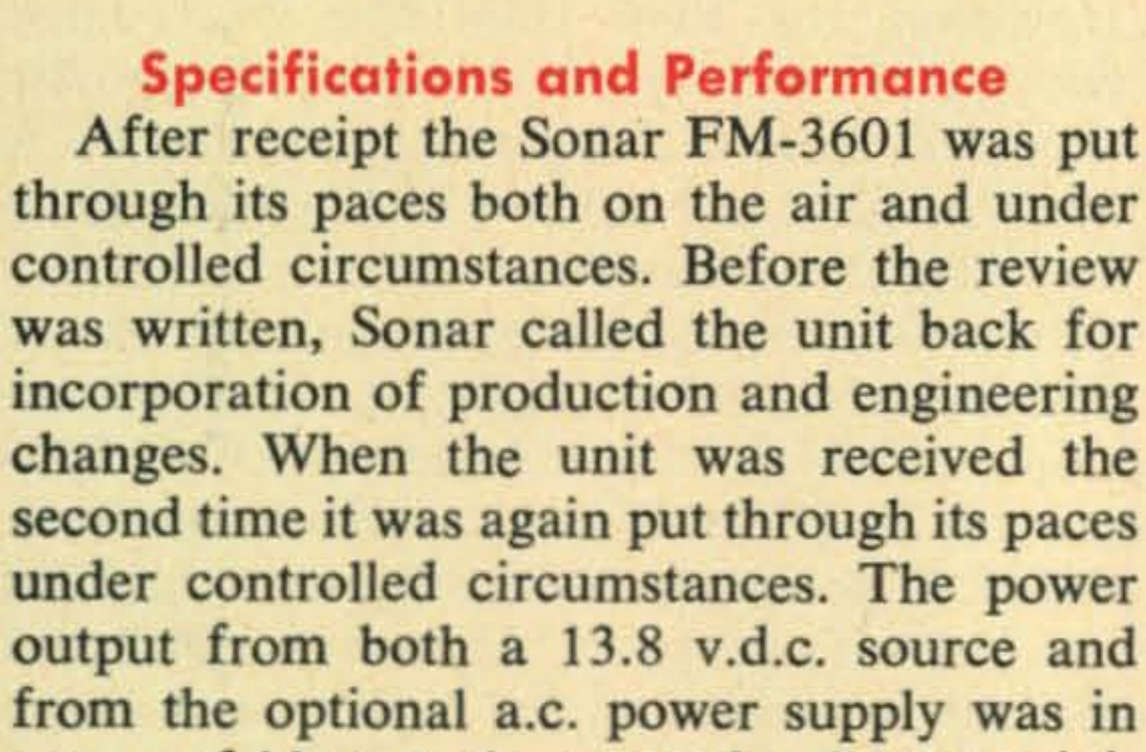
put complete the voice portion. A noise derived squelch circuit completes the receiver.

Specifications and Performance

After receipt the Sonar FM-3601 was put through its paces both on the air and under controlled circumstances. Before the review was written, Sonar called the unit back for incorporation of production and engineering changes. When the unit was received the second time it was again put through its paces under controlled circumstances. The power output from both a 13.8 v.d.c. source and from the optional a.c. power supply was in excess of 11 watts (compared to 8 watts minimum specification). The audio quality of the transmitter was good, but the preset deviation was about ±8 kHz rather than the ±5 kHz specified in the manual. According to Sonar, this was intentional, for amateurs in wideband areas have been complaining about too low transmit audio, so the units are now being set to about ±8 kHz deviation.

The receiver sensitivity was about 0.3 microvolts, well within the 0.5 microvolts (for 20 db quieting) set by Sonar. The receiver audio sounded very good, but the receiver distorted with deviation inputs above ±10 kHz when first received from the factory. Howeve-, after modification the receiver accepted ±15 kHz with no noticeable distortion. Sonar reports that the receiver is designed for narrow band ±5 kHz and not all units will take the ±15 kHz deviation without

[*Continued on page 94*]



Another view of the interior of the Sonar FM-3601. The variances in board coloring are due to the translucent properties of the epoxy board material.

Sonar Model FM-3601 2M Transceiver

GENERAL SPECIFICATIONS:
Size: 6¾"w × 2⅝"h × 9"d
Weight: 5 lbs.
Power Requirements: 13.8 v.d.c. @ .175 a. stdby; 1.9 a. Transmit
Accessories Furnished: Microphone, installation hardware, power cable, crystals for 146.34/146.94; and 146.94/146.94 MHz.

TECHNICAL SPECIFICATIONS:

Receiver	*Claimed*	*Achieved*
Sensitivity (20 db quieting)	0.5 uv	0.3 uv

SSB-ers:

increase talk power, cut "splatter"

Our *444 base station microphone* not only gives you increased talk power, but cuts "splatter" (and QRM complaints) to an absolute minimum! It has superbly tailored response, with sharp cutoffs below 300 and above 3,000 Hz and a rising response characteristic for maximum intelligibility. The 444's rugged, reliable Controlled Magnetic element has been proved in safety communications, and other tough professional communications applications. It delivers a clean signal to the transmitter at levels as high as crystal units! (And, unlike crystal and ceramic units, the element is totally immune to the effects of temperature and humidity.) The 444 also features an adjustable height stand that makes for comfortable "ragchewing" sessions, an optional-locking bar for push-to-talk or VOX operation, and a practically indestructible Armo-Dur® case. Stabilizing Low-Cost Signal Generators

BY PAUL H. BOCK, JR.,* K4MSG

STABLE, accurate, low-cost v.h.f./u.h.f. signal generators are almost non-existant, and although many m.f./h.f. generators provide auxiliary coverage of one or more v.h.f. bands, performance is usually marginal. Nevertheless, it is possible to modify a low-cost signal generator for improved stability, thereby making it more useable, if not state of the art.

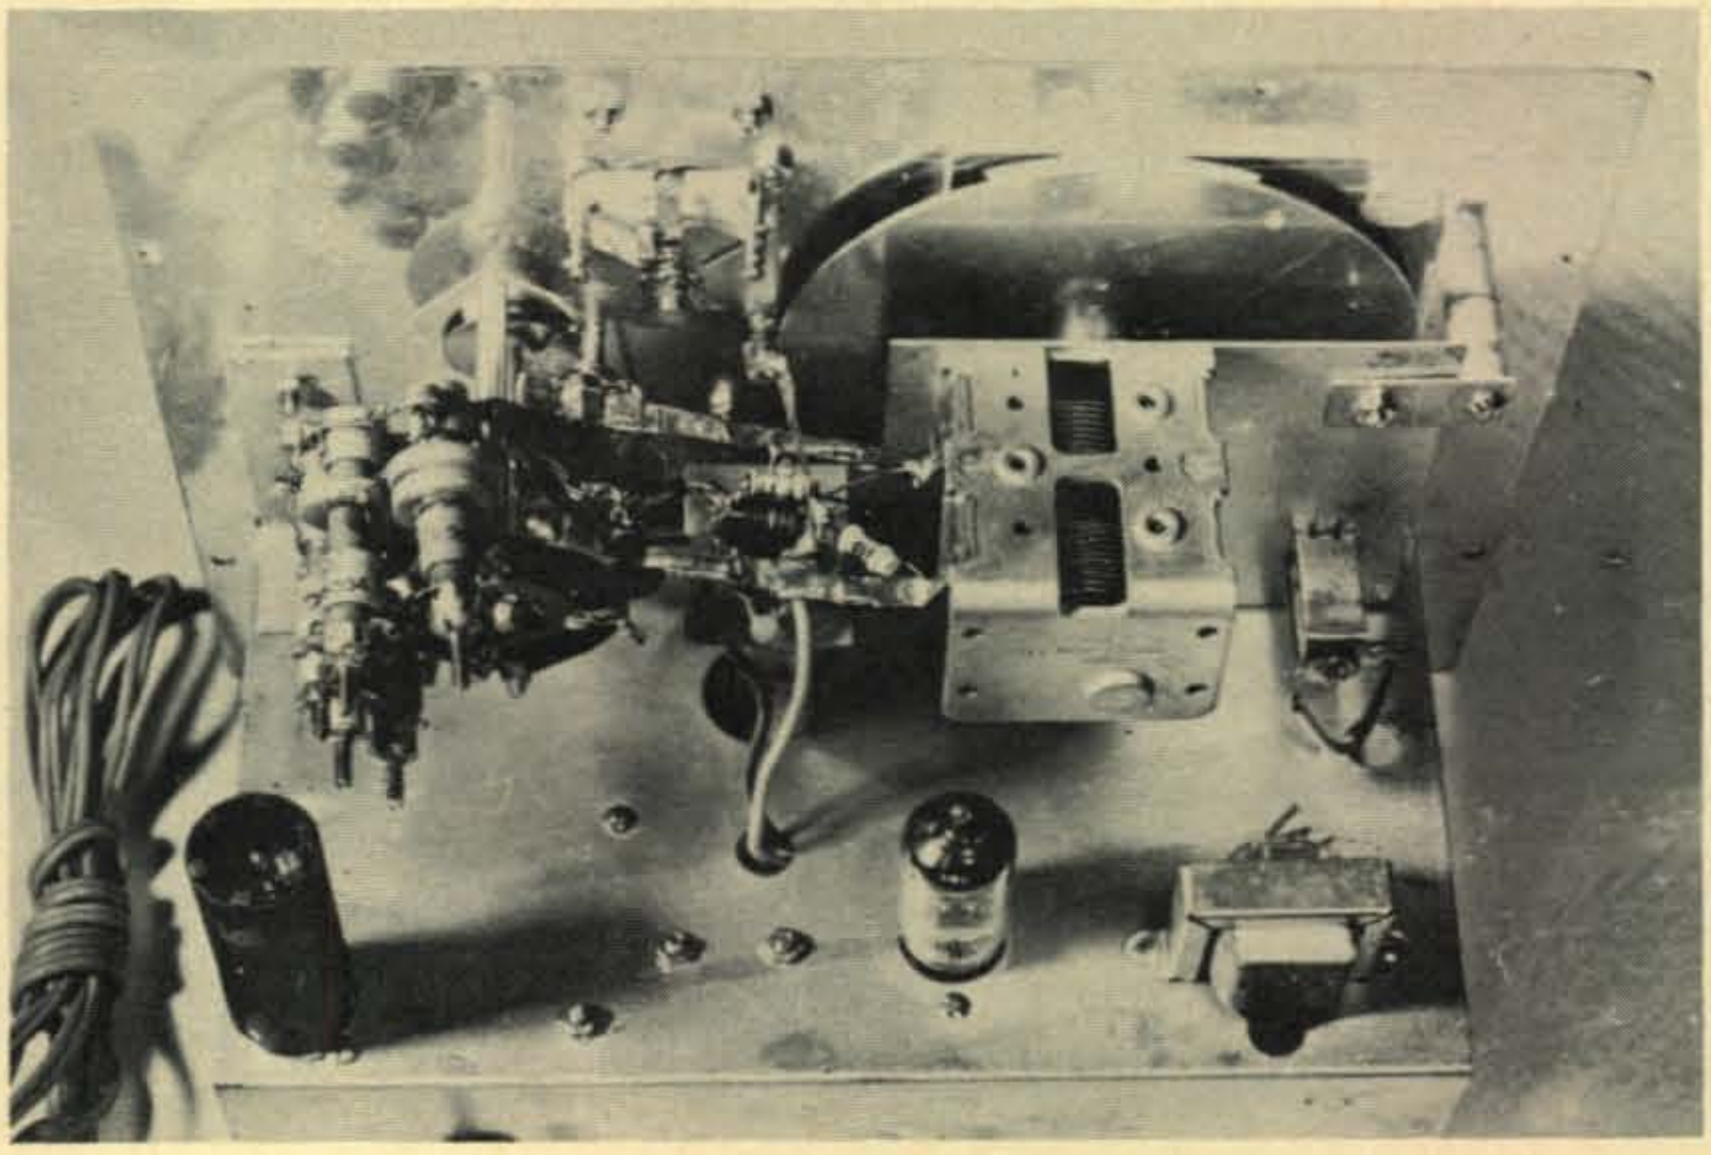
The Eico Model 324 r.f. generator is a typical low-cost unit providing frequency coverage from 150 kHz-145 MHz (fundamentals) and from 111-435 MHz (harmonics). In the m.f./h.f. regions it is reasonably stable, although the tuning rate is poor at higher frequencies. In the v.h.f. region, landing on frequency is touch-and-go, and mechanical instability is significant. However, about five bucks and a little work will improve the electrical and mechanical stability and add a bandspread feature.

The first problem to tackle is electrical stability; this is simply solved by adding a voltage regulator to the B+ line, as shown in the lower left corner of the photo. Since B+ is normally 115-120 v.d.c. unregulated, an 0B2 was chosen for the VR tube. Wiring is simple and straightforward, with one terminal strip being used to support the dropping resistor, R_{17}. Figure 1 shows the circuit modification.

Mechanical Improvements

Mechanical stability was the next problem to be considered, and there just isn't too much that can be done here without virtually rebuilding the equipment, aside from bracing the front panel and the mounting plate for the tuning capacitor, C_{12}. The two braces installed are visible in the photo; the left brace consists of a heavy gauge right angle bracket, intended to aid chassis rigidity when the panel is securely fastened to the cabinet. The right brace is intended to reduce the relative motion between the mounting plate for C_{12} and the front panel, since any such motion will cause C_{12} to change capacitance slightly, thereby shifting the generator frequency. This brace consists of a heavy-gauge metal strip, one end of which is fastened to the tuning capacitor mounting plate. The other end is fastened to a 3/4-inch ceramic standoff insulator mounted on the front panel. The metal strip should be bent, if required, to pre-

*Box 40, USNCS, FPO, New York, N.Y. 09544



Interior view of the modified Eico 324 signal generator. At the top-center of the front panel is the modified butterfly-type variable capacitor used for band spread on the u.h.f. frequencies. At the left rear corner of the chassis is the voltage regulator tube. Note also the angle bracket added between the chassis and panel at the left, and the the small flat bracket and ceramic standoff bracing the tuning capacitor mounting plate at the right.

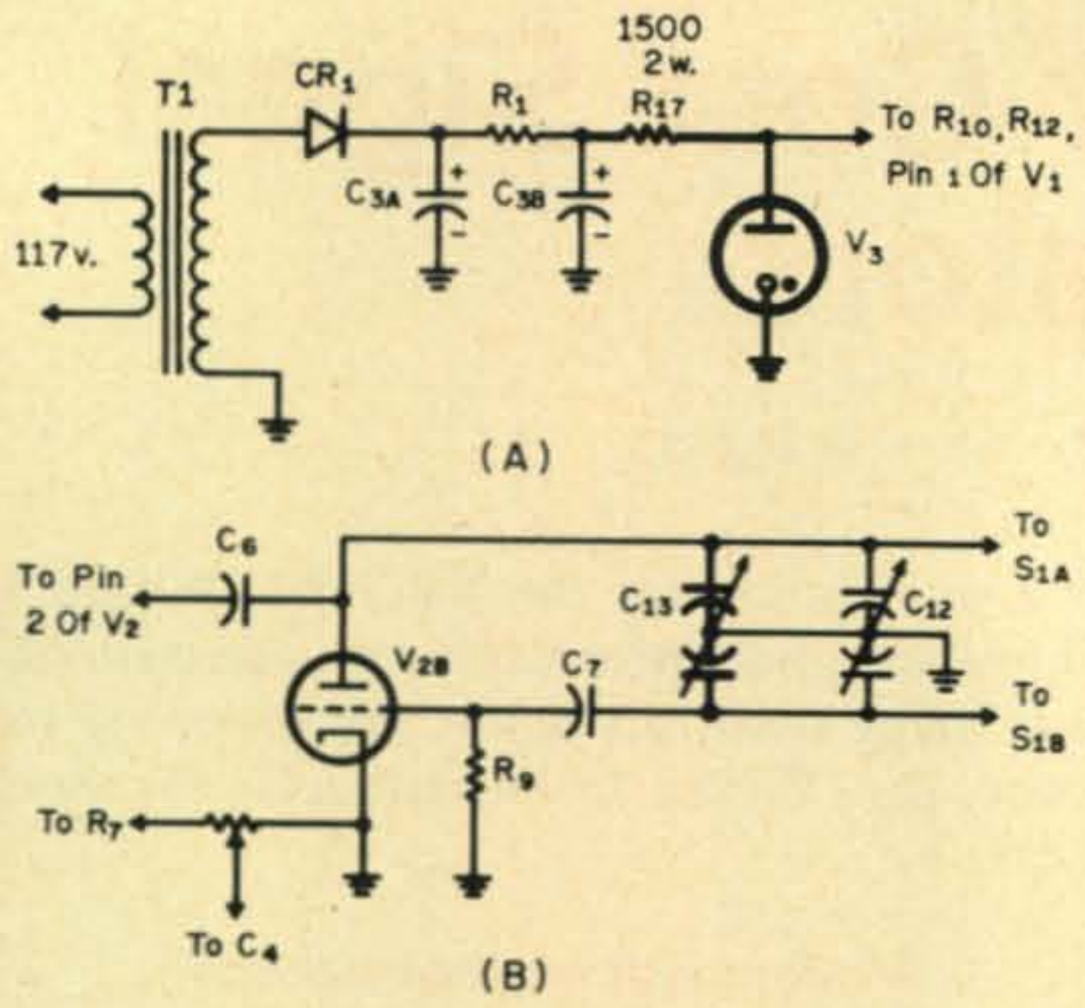


Fig. 1—(A) Schematic showing the addition of an 0B2 VR tube to the signal generator power supply. (B) Addition of bandspread capacitor C13 to the signal generator. The unit used by the author was a 2.3-10 mmf butterfly type with plates removed as described in the text. Added components are shown in heavy lines.

vent the front panel from being warped inward or outward. Otherwise, some difficulty might be encountered installing the equipment back in its cabinet.

Tuning Rate

As far as the author was concerned, the tuning rate in the v.h.f. region was the biggest shortcoming of the equipment. Several different ways of alleviating this problem were tried and rejected, and there are holes in the equipment to prove it (quite a few screws in the author's 324 do nothing but fill extra holes!). Finally, it was decided that a small bandspread capacitor for fine tuning was a simple and economical approach which should satisfactorily achieve the desired result: the ability to tune to within a kHz or two

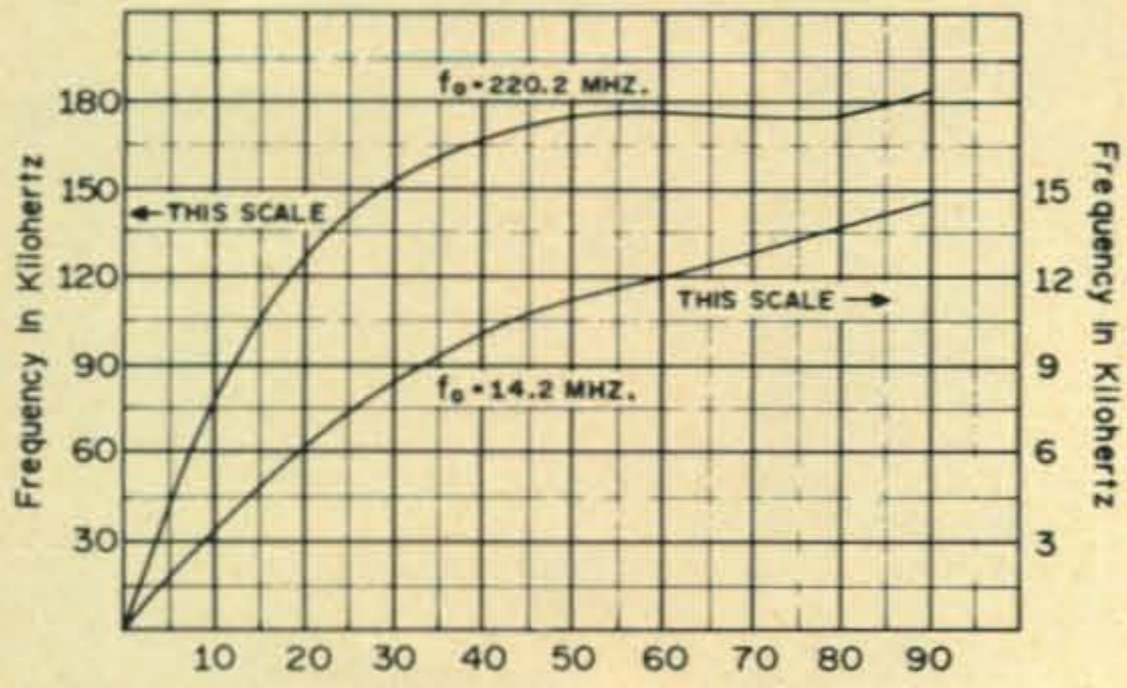

Fig 2—Drift rate curves for the Eico 324 signal generator as modified by the author.

of the desired frequency in the v.h.f. region. The bandspread capacitor, C_{13}, is visible in the photo, with the wiring modification indicated in the schematic of fig. 1. Either a butterfly or split-stator variable must be used, since V_2 operates as a Colpitts oscillator with the split-stator tuning capacitor, C_{12}, serving as the capacitive voltage divider. If the butterfly type listed in the parts list of fig. 1 is used, remove all the rotor plates but one, and all the stator plates but one, in each section. Since the bandspread is only vital in the v.h.f. region, a very small range of capacitance is all that's required. In addition, the added capacitance of C_{13} will affect the calibration, as mentioned later, so a small maximum capacitance is advantageous from this standpoint.

It is worth noting that a butterfly capacitor covers the full range from minimum to maximum capacitance in a quarter turn of the shaft, while a split-stator variable covers the same range of capacitance in a half turn. Thus, the split-stator provides twice the "band-spreading" effect of a butterfly having the same capacitance range. For this reason, the author recommends a split-stator; a butterfly was only used because it was readily available.

Note the copper strap conductors used to replace the wire conductors originally installed. The strips were cut from thin flashing copper, and were used to reduce the total inductance of the tuned circuit and thus compensate for the increased circuit capacitance introduced by C_{13}. A similar strip was used to replace the wire inductor used as the coil for Band F, and the resulting dial calibration is fairly accurate (Band F is not adjustable). Prior to these modifications, the dial showed an error of approximately 20 MHz at a frequency of 220 MHz when C_{13} was installed; after modification, the dial reads within 5 MHz of the actual frequency at 220 MHz. The excess solder on the copper strips is for weight loading, and prevents the strips from vibrating when the cabinet is bumped.

Other Changes

Two additional modifications were made, not necessarily for improved v.h.f. performance, but more as a general up-grading of the equipment. The author's 324 possessed an undesirable amount of hum in the output, a condition which was alleviated by replacing the dual-section (20-20 mf.) electrolytic in

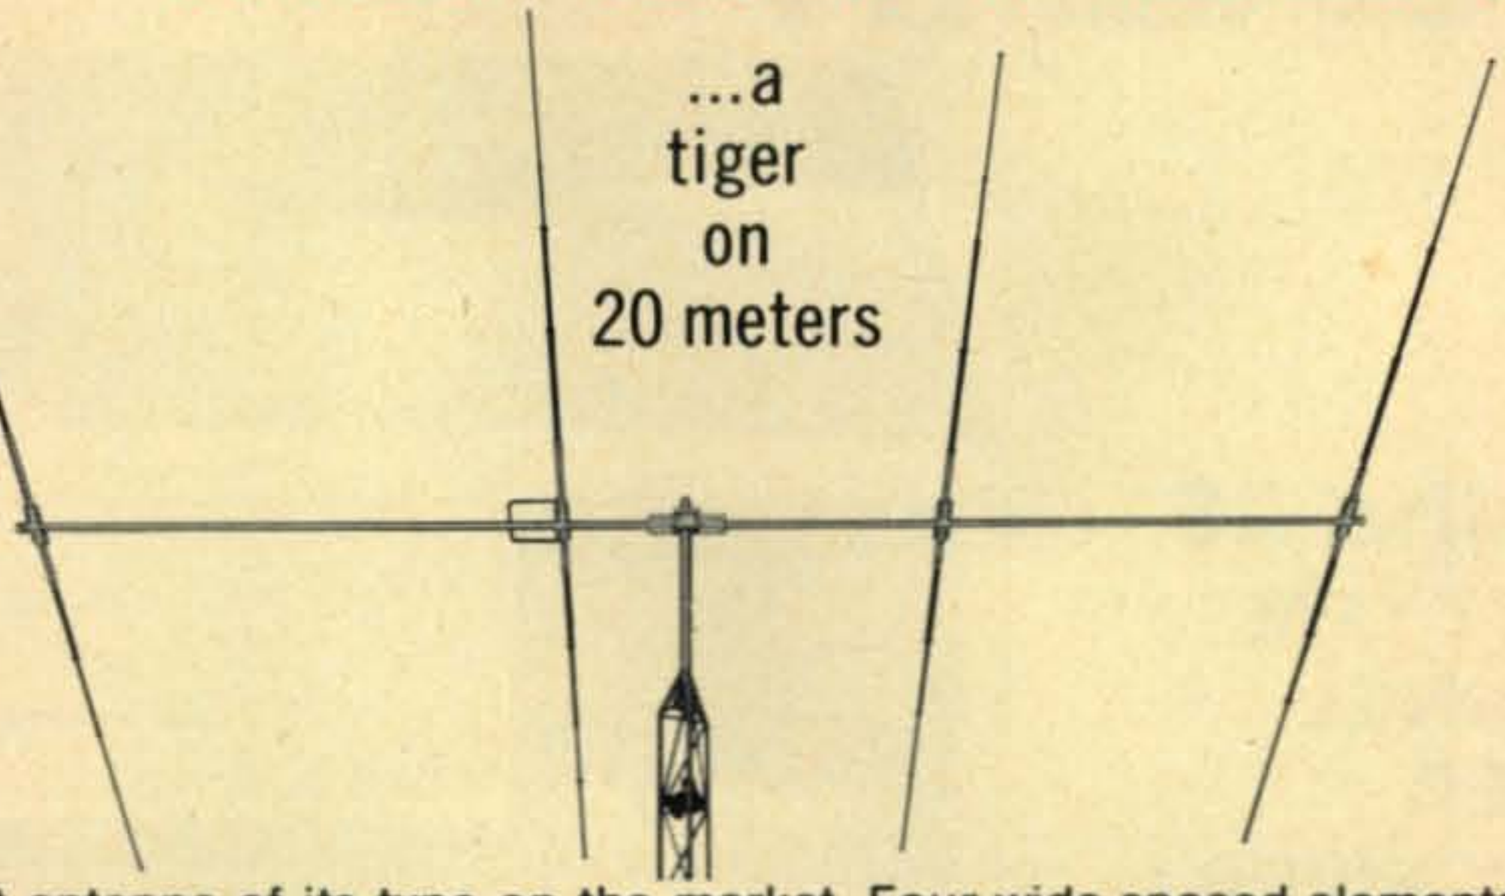
for the most advanced antennas under the sun!

HY-GAIN 204BA MONOBANDER



The best antenna of its type on the market. Four wide spaced elements (the longest 36'6") on a 26' boom along with Hy-Gain's exclusive Beta Match produce a high performance DX beam for phone or CW across the entire 20 meter band.

- 10 db forward gain
- 28 db F/B ratio
- Less than 1.05:1 SWR at resonance
- Feeds with 52 ohm coax
- Maximum power input 1 kw AM; 4 kw PEP
- Wind load 99.8 lbs. at 80 MPH
- Surface area 3.9 sq. ft.

The 204BA Monobander is ruggedly built to insure mechanical as well as electrical reliability, yet light enough to mount on a lightweight tower. (Recommended rotator: Hy-Gain's new Roto-Brake 400.) Construction features include taper swaged slotted tubing with full circumference clamps; tiltable cast aluminum boom-to-mast clamp; heavy gauge machine formed element-to-boom brackets; boom 2" OD; mast diameters from 1½" to 2½"; wind survival up to 100 MPH. Shipping weight 51 pounds.

See the best distributor under the sun...the one who handles the Hy-Gain 204BA Monobander.

Model 204BA (4-element, 20 meters).....**$149.95**
Model 203BA (3-element, 20 meters).....**$139.95**
Model 153BA (3-element, 15 meters).....**$ 69.95**
Model 103BA (3-element, 10 meters).....**$ 54.95**

FERRITE BALUN MODEL BN-86

Improves transfer of energy to the antenna; eliminates stray RF; improves pattern and F/B ratio. **$14.95**

25 Watts isn't everything, but with everything else it's GREAT!

GLADDING 25™

- 25 WATT • FM
- 6 CHANNEL
- 2 METER
- TRANSCEIVER

We loaded this rugged, new, two-meter radio with 25 watts of power and then packed it with desirable features that make it the most wanted two-meter amateur radio on the market. It's the Gladding 25™ from Pearce-Simpson, Division of Gladding Corporation and the World's largest manufacturer of marine communications equipment. Best of all, because of our unmatched marine volume, we could add a price tag to it that can't be matched by anyone, anywhere, and still give it custom quality. Great! 25 watts and a lot more, from Pearce-Simpson.

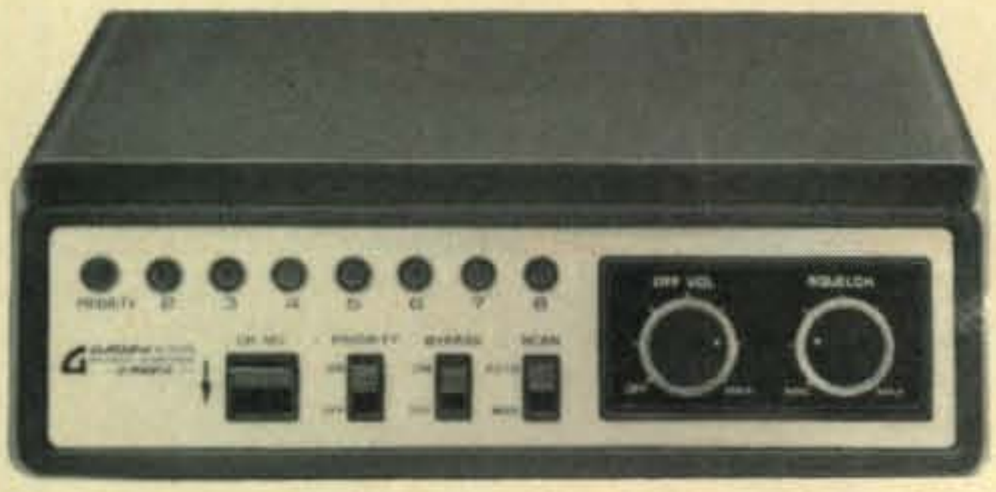
• 25 watts output • 0.3uv sensitivity for 12db SINAD • built in 12 volt power supply • matching AC power supply accessory • 6 separately switchable transmit and receive channels • Economical vacuum tube driver and final.

• Plus • 8 pole crystal lattice filter • Transistor sockets • Glass epoxy printed circuit boards • Quick disconnect power plugs • Mounting cradle • 1 watt output switch

$249.95* mobile unit

$295.95* with accessory AC Power Supply

Suggested List Price



GLADDING HI-SKAN™

8 Channel VHF Monitor

• Automatically scans 8 preselected channels • Switch for manual selection of channel • Priority channel • Bypass channel • 115VAC/12VDC built in power supply • Mounting cradle • Can be tuned to 2 meters.

$99.95*

Sunspot Cycle 20—Progress 1971: Prediction 1972

BY GEORGE JACOBS,* W3ASK

THE present sunspot cycle, the 20th recorded since solar records have been kept, began during October, 1964 with a *smoothed sunspot number* of 9.6. The smoothed sunspot number is a value derived from the average number of sunspots that have been observed on the face of the sun at the Swiss Solar Observatory over a 12-month period. It is used internationally as an index of solar activity.[1]

Cycle 20 reached its peak during November, 1968 with a number of 111. The course of the present cycle is shown graphically in fig. 1, while the actual values of smoothed sunspot numbers are given in Table. 1.

The decline of Cycle 20 began during December, 1968, reaching a value of 106 by April, 1969. Solar cycle activity then remained practically constant for an unprecedented long period of time, until June, 1970. The cycle began to decline again during July, dropping to a smoothed sunspot number of 82 by the end of 1970.

Progress 1971

Solar activity declined considerably during 1971.

According to the latest available solar data, 1971 began with a smoothed sunspot number of 78. By the end of the year the cycle had declined to an estimated level of 53.

Despite this fairly rapid decline, solar activity during 1971 was still in the *moderate* range. There were, however, some noticeable changes in shortwave radio propagation conditions. For example, regular F-2 layer DX openings on 6 meters were no longer possible, and there was a considerable decrease in the number of DX openings on the 10 meter band.

Although excellent DX conditions held up on 15 meters, especially during the hours of daylight, the band opened somewhat less often than during periods of higher solar activity. A decrease was observed also on 20 meters during the hours of darkness, but otherwise this band held up very well for DX propagation during 1971.

DX propagation conditions tend to *improve* on the lower frequency bands as solar activity declines, and a slight improvement was noted during 1971 on 40, 80 and 160 meters during the hours of darkness.

Prediction 1972

The new year is expected to begin with solar activity at a level of approximately 51. By the end of the year the cycle will probably have declined to a level of 36. By mid-

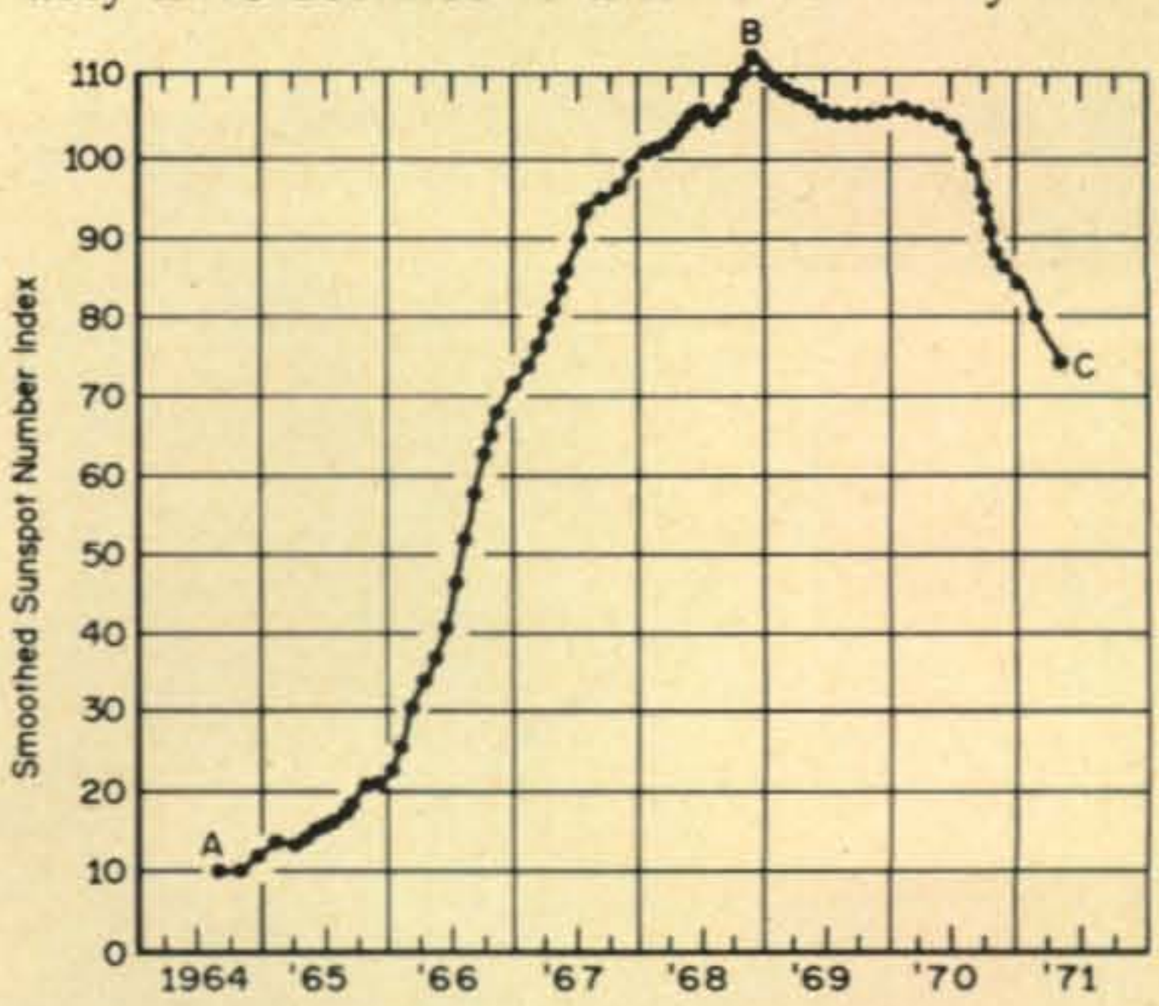

Fig. 1—Progress of Sunspot Cycle 20. At A, the cycle's beginning with a smoothed sunspot number of 9.6. At B, the peak of the cycle at an index of 111. At C, the latest available number, 75, centered on February 1971.

*11307 Clara Street, Silver Spring, Md. 20902

[1] For a more detailed discussion of solar cycles, and methods for predicting solar activity see, "A Sunspot Story—Cycle 20; The Declining Years," Jacobs, G. and Leinwoll, S. *CQ* Nov. 1969, p. 44.

Table 1

Values of smoothed sunspot numbers observed during Cycle 20. Bold face figures indicate values predicted for the remainder of the cycle.

	1964	1965	1966	1967	1968	1969	1970	1971	1972	1973	1974	1975

No.	10	22	70	97	111	105	87*	55	37	24	12	
Dec.	11	24	73	101	110	105	82*	53	36	23	12	

*Provisional values. May vary slightly when additional data is available.

1972, the cycle is expected to enter a phase of *low* activity, when the smoothed sunspot numbers drop below 45.

Beyond 1972, the cycle is expected to continue to decline until a minimum value is reached, probably by mid-1975. The predicted remainder of Cycle 20 is shown graphically in fig. 2, and by the smoothed sunspot numbers appearing in bold face in Table 1.

With the continued decline of solar activity expected during 1972, there should be corresponding changes in DX propagation conditions on the amateur shortwave bands.

No regular F-2 layer 6 meter openings are likely to occur during 1972. DX possibilities on 10 meters should also decrease considerably. Some fairly good openings should still be possible during the daylight hours to southern and tropical regions, especially during the early spring, fall and winter months, but openings to most of Europe and Asia will be few and far between.

DX propagation conditions are expected to remain good on 15 meters during most of 1972, especially during the spring, fall and winter months, when openings are expected to most areas of the world during the daylight hours. The band is expected to fold rapidly after sunset.

Good-to-excellent DX propagation conditions are expected on 20 meters throughout the daylight hours of 1972, with the band peaking around sunrise and again during the afternoon hours. Considerably poorer conditions are expected after sunset, with little DX possible except during the summer months.

An improvement is expected in DX propagation conditions during the hours of darkness on 40, 80 and 160 meters. Good openings to most areas of the world should be possible on 40 meters during 1972, from shortly before sunset and until shortly after sunrise, especially during the spring, fall and winter months. Fair-to-good openings to many areas of the world should also be possible on 80 meters during the hours of darkness, except perhaps during the summer months when static levels are very high.

Propagation conditions on 160 meters are

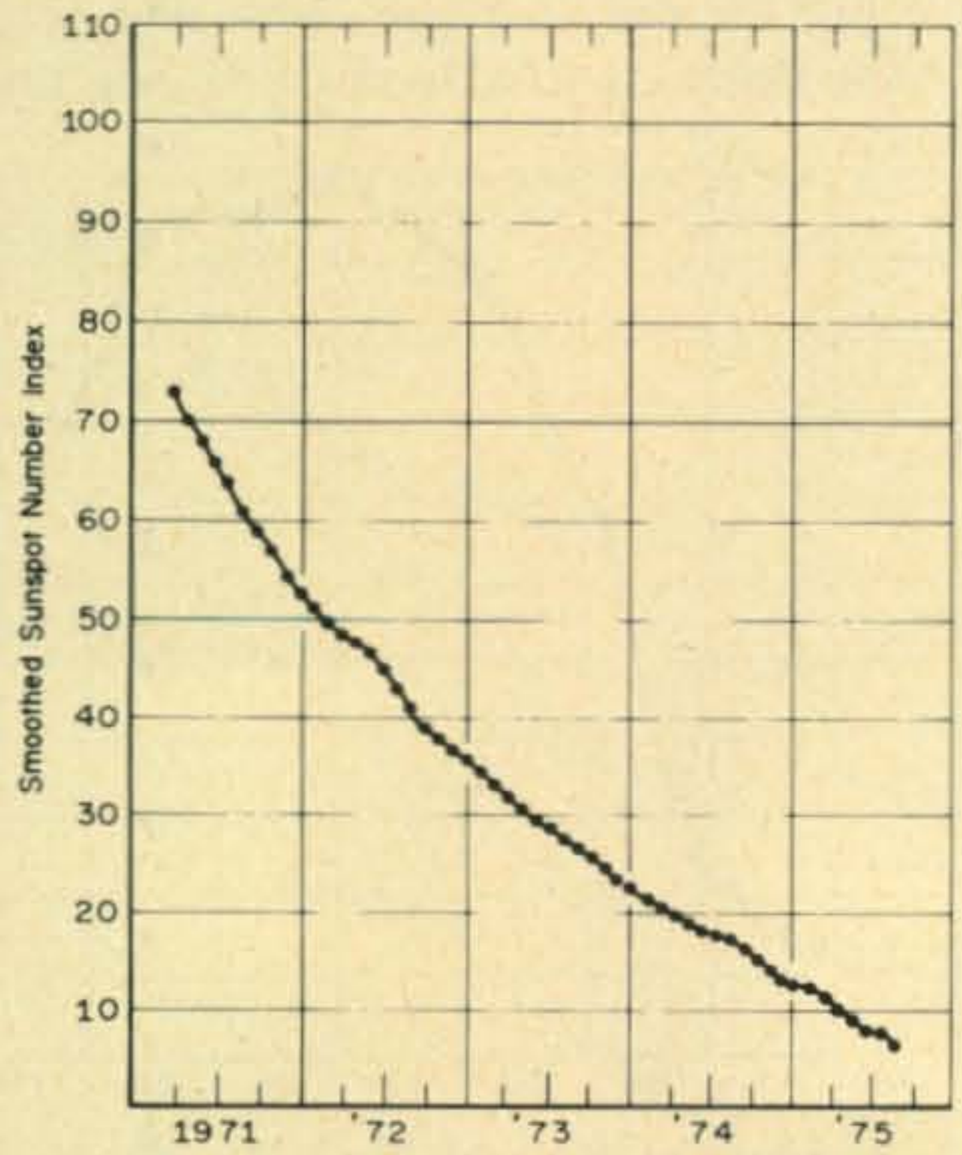

Fig. 2—Predictions for the remainder of Sunspot Cycle 20. The minimum of the cycle is expected by mid-1975. During 1972, the solar index is expected to decline from 51 to 36.

[*Continued on page 92*]

For $495 you can operate a two-way Robot SSTV station.

Now with the purchase of a Robot SSTV monitor only, Robot will make you a free personalized SSTV tape that will enable you to transmit a video SSTV signal without having to own an SSTV camera. After you have purchased your Robot monitor, just mail us the call sign card, photos, drawings, etc. that you want on your tape, and we will make up a five-minute tape for you (reel or cartridge) and send it to you by return mail. You then simply play the tape on an audio tape recorder that is plugged into the mic jack of your transmitter or transceiver, and you are transmitting an SSTV video signal.

Now, for just $495.(the cost of the Robot SSTV Monitor alone) you can join the many amateurs who have already made great progress towards their WAC, DXCC, and WAS certificates for two-way SSTV.

If you are already operating SSTV, you will be interested to know that we are preparing a directory of SSTV operators. Send us a post card with your QSL and we will include your call in our directory and send you a copy.

See the complete line of Robot SSTV equipment at your nearest dealer.

CQ Reviews: The Curtis Devices EK-402 Programmable Electronic Keyer

BY WILFRED M. SCHERER,* W2AEF

SOME time ago *CQ* reviewed the Curtis Electro Devices "Electronic Fist," a sophisticated electronic keyer that includes automatic transmission sequences pre-programmed for the customer.[1] A newer version is one that "sophisticates the sophisticated" with the incorporation of a method by which the operator himself may set up or alter any of three different programmed sequences. This unit is the Model EK-402.

Retained are the other features of: perfect dot memory (no missed dots—no extra dots); self-completing dots and dashes; jam-proof spacing; calibrated 8-50 w.p.m. speed range; variable weighting; Iambic-squeeze or single-lever keying; provisions for manual keying; sidetone monitor with built-in speaker, level and pitch controls, transmitter-tune position; all solid-state with operation from 117 v.a.c.

General Details

The EK-402 consists of two major sections. The first is a basic Iambic keying circuit employing an instant-starting clock oscillator and a dot memory. The general data on this phase of operation will be found in the previous review.

In addition, this model differs from the earlier ones in the dash lockout circuitry and the incorporation of a feedback setup that provides increased tolerance to oxidized key contacts. Shunt diodes have been added across both the dot and dash inputs to provide protection against accidental application of overvoltages on the key terminals.

The EK-402 also has added built-in arc suppression for the reed relay and two transmitter connections; one for grid-block and cathode-keyed rigs and one for solid state gear that requires a low-resistance key circuit. A sidetone output jack is included for headphone use with rigs not equipped with an internal keying monitor.

Memory Section

The memory section of the EK-402 consists basically of a 256-bit MOS Random-Access Read-Write integrated-circuit memory steered by two divide-by-sixteen synchronous counters. The clocking signal for the counters comes from the keyer clock oscillator which free runs during programming (so it can count off pauses as well as characters).

As noted later, the memory is divided into three sections. Switching between programs is accomplished with a two-input, four-bit multiplexer IC (equivalent to a 4 p.d.t. switch) controlled by a PROGRAM switch. Five other IC's in the memory section provide timing and control functions.

*Technical Director, *CQ*.

[1] "*CQ* Reviews the Curtis Electro Devices Electronic Fists," *CQ*, January 1971, p. 54.

The Curtis Electro Devices Model EK-402 Programmable Electronic Keyer.

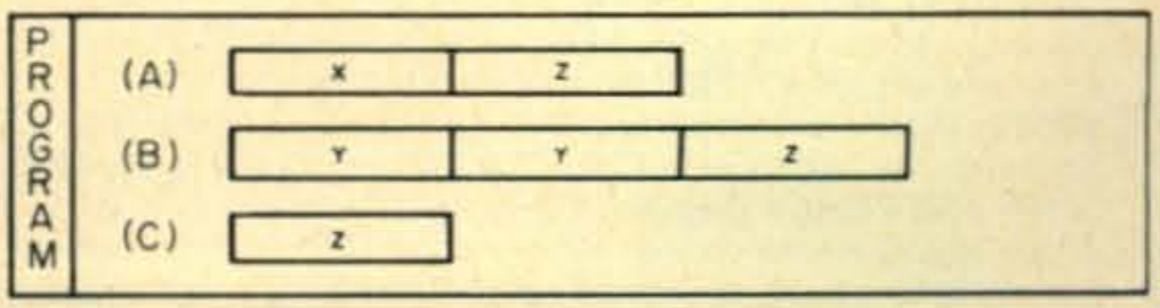

Fig. 1—Memory quadrants as they will play back on the different programs.

Programming

Any one of the programmed sequences may be selected by a switch and made to automatically operate the keyer when a start button on the keyer panel or an external switch is depressed. A panel switch also may be set to transmit one cycle of the selected program or to repeat each cycle at any desired interval of up to 30 seconds according to the setting of an additional panel control. Any sequence may be instantly stopped by depressing a STOP button on the panel or by commencing to hand-operate the keyer using the external paddles. This automatically disengages the memory, allowing the operator to break into a memory sequence for an emergency stop or to add a different ending or to start the body of a message.

The automatic repeating cycle with a variable delay is provided for send-and-wait CQ's. This can be useful when a band appears to be dead or relatively inactive, or for meteor scatter and aurora bounce work. The repeat cycle is automatically terminated when manual sending is started or when the STOP button is depressed.

Programming a sequence is simply accomplished with the PROGRAM switch set for the desired sequence and setting a READ-WRITE switch to the WRITE position. The memory writing sequence is delayed until the operator begins to key the dot or dash paddle. The delay allows mental preparation before initiating the start. The memory sequence for programming also may be initiated by depressing either the START button or an external switch (such as the straight key on a Brown Bros. Model CTL, as described in the previous review). This allows the provision of a blank space at the beginning of a program. Two panel lamps indicate the time elements involved and when one cycle of any program is completed.

The programs may be written using any speed selected by the SPEED control and when used to automatically operate the keyer, will do so at any speed subsequently selected. When a program sequence is written, any previously recorded data on that sequence is automatically erased. On the other hand, the programmed material can be retained by the memory setup for each program and thus does not have to be re-written after each transmission or whenever the power to the keyer unit has been turned off and on. This is made possible by the use of an internal battery that is switched in for the memory when line power is interrupted. The battery power is applied to only the memory cells, allowing retention of the recorded programs at a minimal power drain when the a.c.-line power is not connected. There is no way to lose memory content other than by physically removing the memory battery.

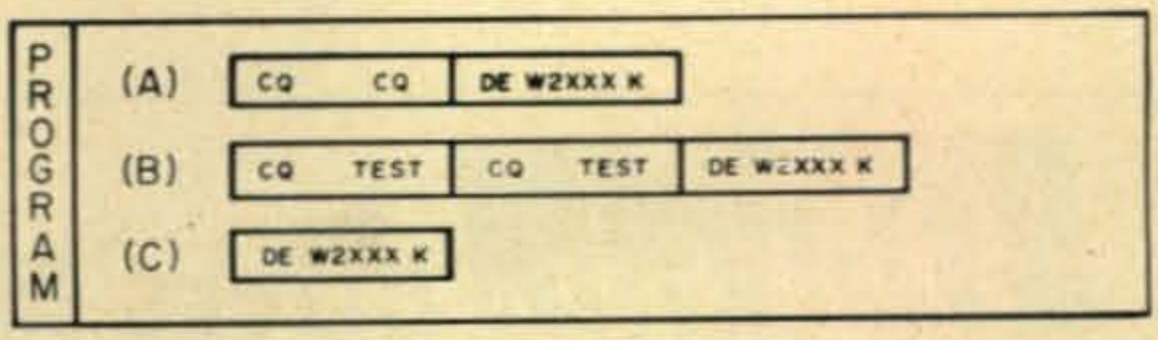

Fig. 2—Data in the quadrants can be interchanged between programs only as shown here; that is, the information can be different only between quadrants X and Y. That in quadrant Z always remains the same.

Program Material

All three programs are interdependent. There are therefore, some limitations as to the material used for each program, in addition to which the maximum possible length of a program sequence is different in each case.

A program sequence is made up of various sections recorded in "quadrants" of the memory system and is restricted to the data recorded in the different quadrants as shown at fig. 1. Quadrants X and Y each will handle up to about six characters, while quadrant Z will take about 8 characters.[2] Quadrant Z actually consists of two quadrants but functions only as one entire section.

Whatever data is recorded in quadrant X appears *once only* in program A. That recorded in quadrant Y appears *twice* in succession *only* in program B and that of quadrant Z appears *once* or as the last section in *all* pro-

[2] The number of characters in each quadrant is dependent on the length of each character.

[*Continued on page 92*]

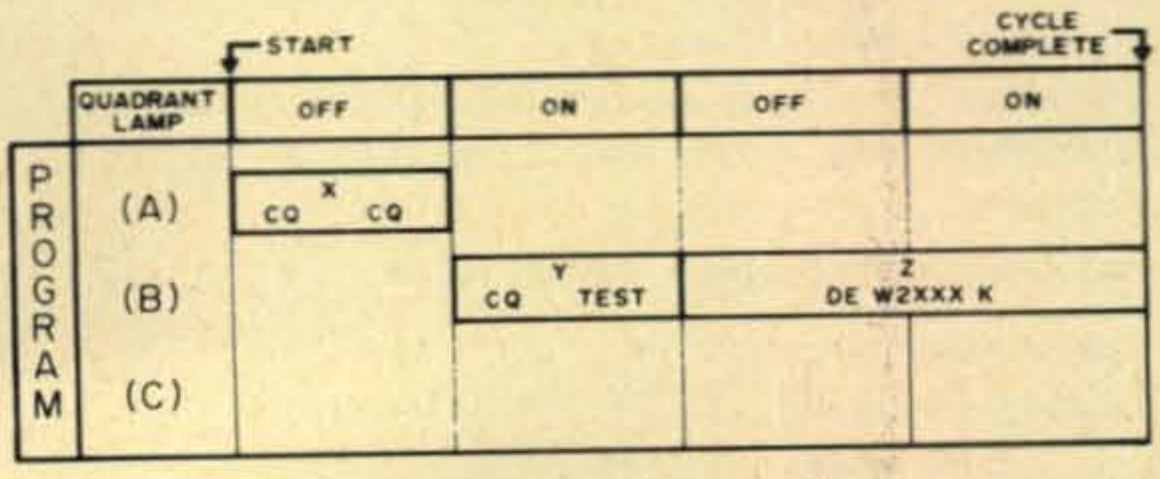

Fig. 3—Writing sequences for each program sequence in relation to quadrant-lamp indication, following which programmed sequences will play back as shown at fig. 1.

DYCOMM offers MORE WATTS per $$$

DYCOMM *broadband, no tuning, ready to use boosters can increase your transmitted power up to 45 times. Fully automatic, hands off operation.*

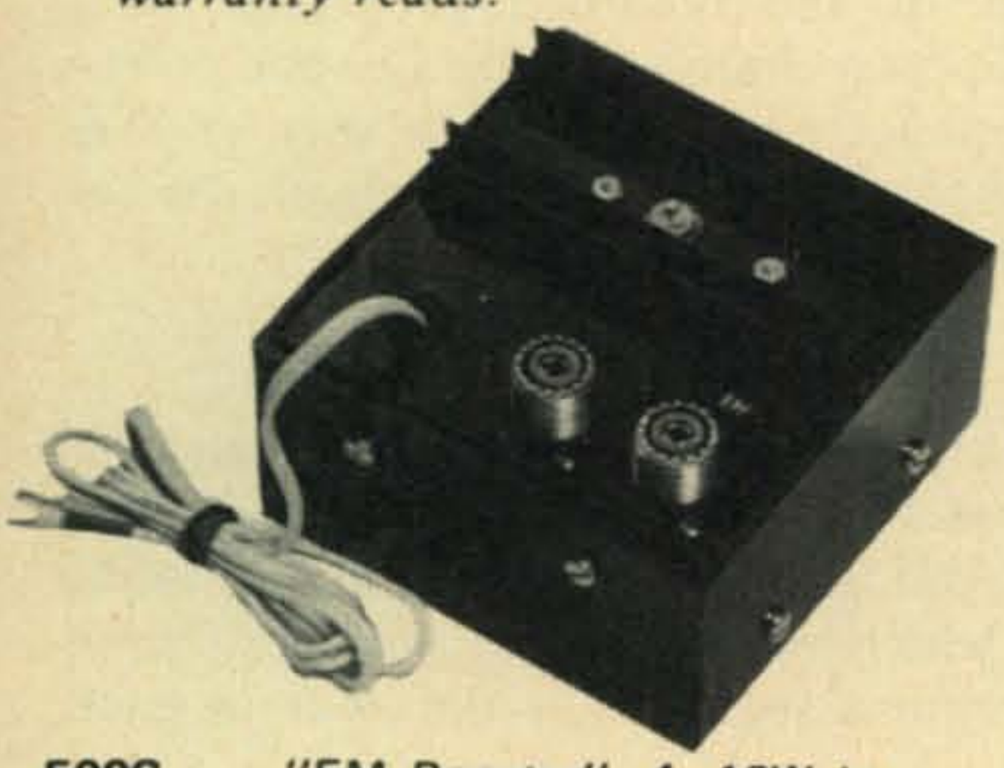
DYCOMM *boosters work with virtually every 2M FM rig.*

DYCOMM *boosters are reliable, inexpensive, straightforward, small in size and big in performance.*

DYCOMM *boosters all operate on 12 15 VDC.*

Over 2,000 satisfied users have never paid a cent for a repair: in fact, part of our warranty reads:

". . . If you ever have a problem with your booster take it to any DYCOMM dealer and he will replace it free of charge; if it is out of warranty he will give you another booster and we will charge you for repairs if it seems appropriate . . ."



500C "FM Booster", 4–12W in, 15–30W out 10W input/ output 25W ..... **$ 59.95**

500D "Block Booster", 8–12W in, 35–55W output, 16W of drive is FB, this outstanding bargain is still only ..... **$ 89.95**

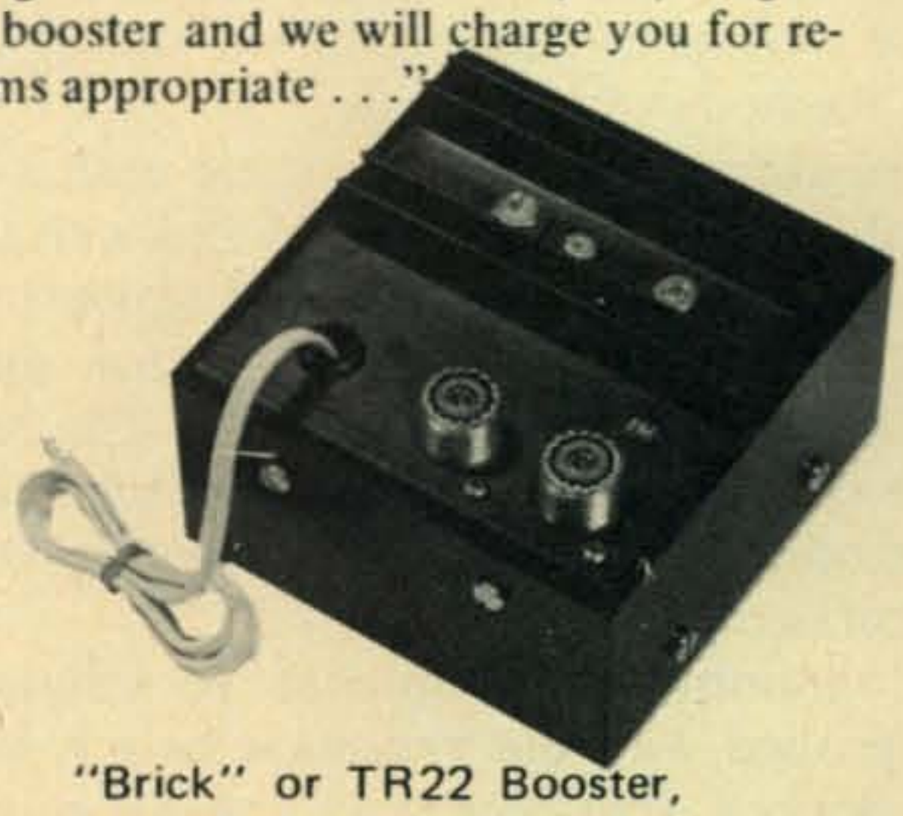
All boosters have automatic low insertion loss in/out switching. All operate from 12–15V DC. Isn't it time you also went DYCOMM??

They are rugged: built to take vibration, load mismatch and over-voltage.

To order: See your nearest DYCOMM dealer, if none near you, order direct and add $1.55 for shipment.

For more information, call or write:

JIM – W4MRI
(305) 844-1323/
844-1324.



500E "Brick" or TR22 Booster, one of the most popular, your 1–2W HT can push out 20–25W ..... **$ 69.95**

500ES "Super Brick/TR22 Booster", now you can have from 35–45W for .8–2 watts input. Typically 38W output/1W input ..... **$ 99.95**

10–0 The ultimate in solid state power 8–15 watts input will put out 80W min.,- 125W max. Typically 100W output/10W input, – 90W min. **$185.00**

35–0 Provides 80–110W output for 25–40W input, typically 100W output for 35W input **$165.00**

DYCOMM

DYNAMIC COMMUNICATIONS, INC.
948 Avenue "E" Riviera Beach, Florida 33404

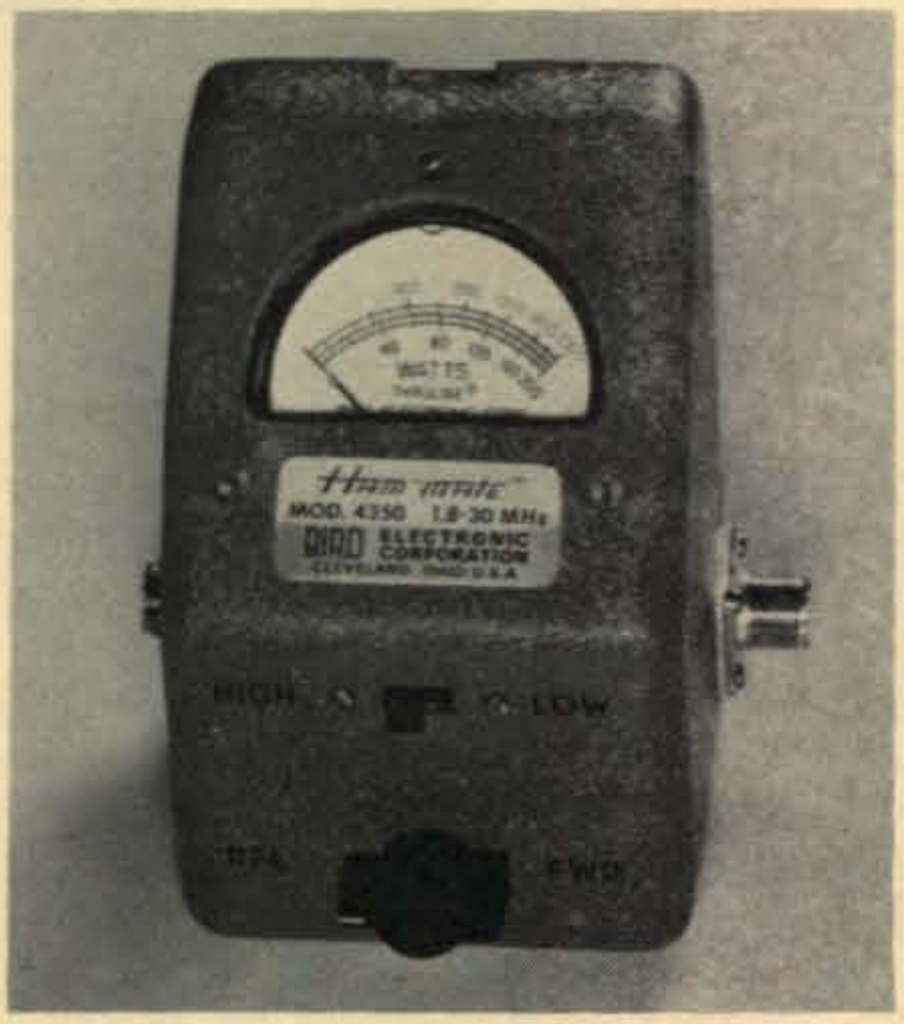
New Amateur Products

Comcraft

Here's a rather unique little item from Comcraft that should be most interesting to VHF fans. The CTR-144 transceiver operates on both a.m. and f.m. on two meters. An all solid-state rig, it runs 12 watts input in either mode, with a built-in v.f.o. and crystal provisions, as well. This unit may be operated on either a.c. or d.c. It has an S Meter, MOS front end, double conversion receiver, squelch control, noise clipper for a.m. and discriminator for f.m. Quite an interesting package. For more info., write Jack Dickenson, Comcraft Company, P. O. Box 266, Goleta, Calif. 93017, or Circle B on the reader-service card.

Aero-Metrics

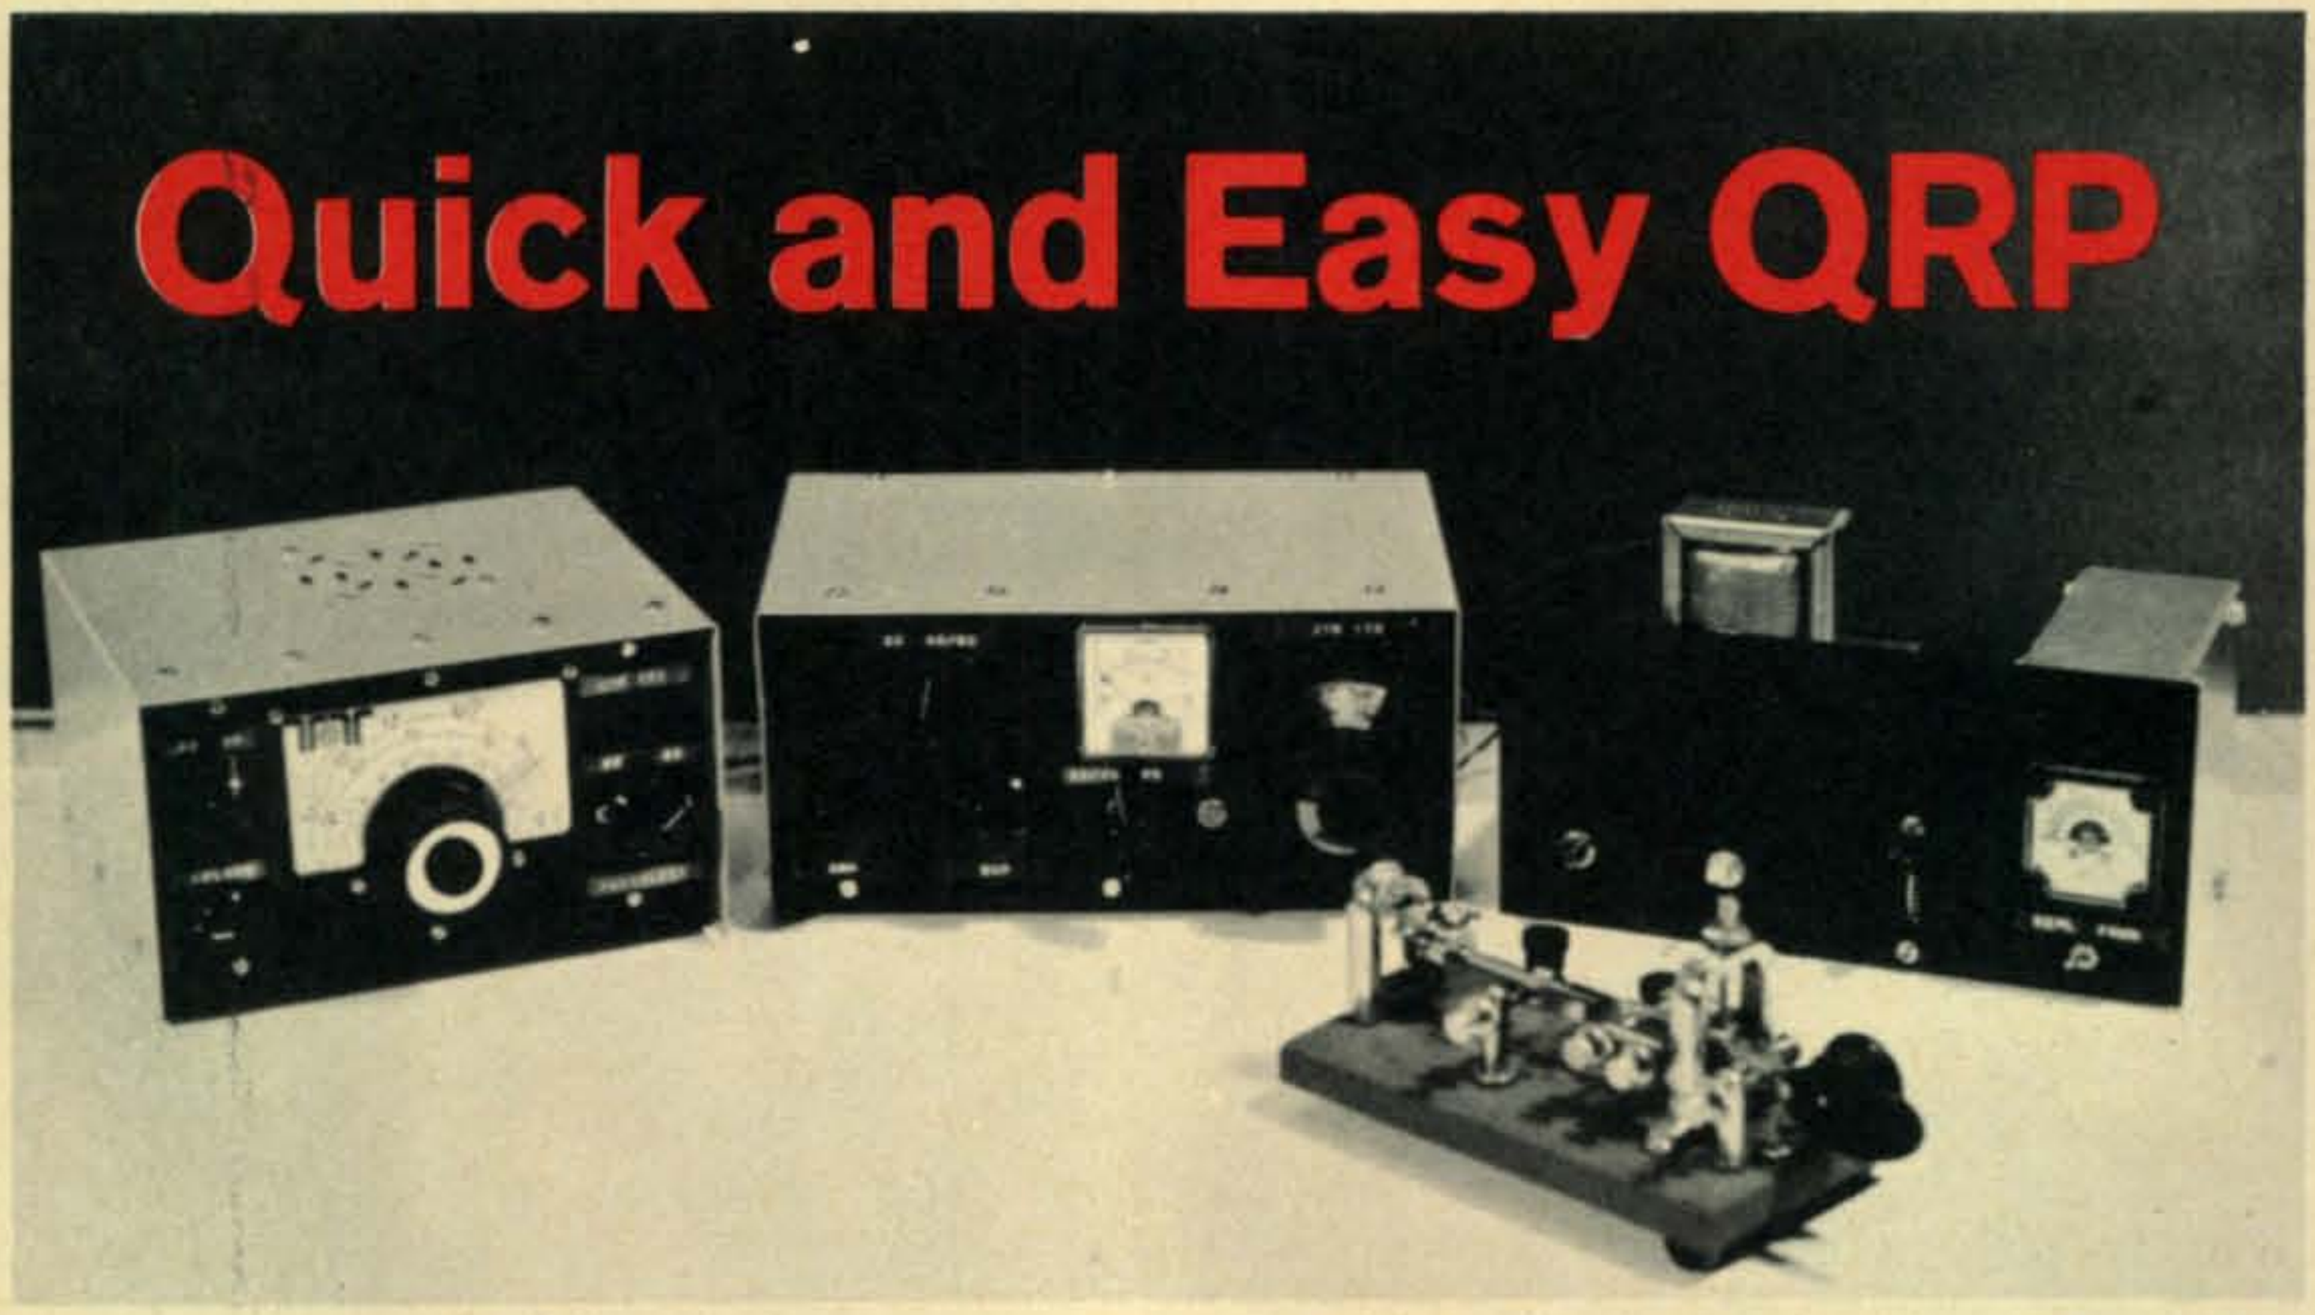
Aero-Metrics General has announced a new solid-state digital clock line, with a choice of 12 or 24 hour models. These clocks use a bright red neon readout tube complement rated at 200,000 hours or 22 years. The unit includes 15 IC's, 4 transistors and 7 diodes. Accuracy is guaranteed to within 3 seconds per year. These clocks also feature a built-in rechargeable battery to hold circuit time during short interval power failures. Also featured is a neon flash which operates for 30 seconds every 10 minutes as a station-ident call reminder. A disable switch is provided for this flasher. A variety of cabinets and prices also offered. For further information contact—Aero-Metric General, Inc., 155 Franklin St., Dayton, Ohio 45402, or circle Letter A on the reader-service coupon.



Bird Electronics

Bird Electronic Corporation announces the debut of an r.f. Wattmeter designed especially for the amateur radio market. There are actually three models, two of which cover the 1.8—30MHz range (160 meter to 10 meter bands) and the third covering 50—150MHz (6 meter and 2 meter band). The Model 4350 measures forward and reflected power in two ranges: 200W and 2000W, while the Model 4351 has ranges of 200W and 1000W. The Model 4352 has ranges of 40W and 400W covering the two v.h.f. bands of six meters and two meters. The new line of wattmeters are designated HAM-MATE , and use the well-known Thruline construction, made famous in the industrial field by the Model 43. The new Ham-Mate has a minimum of 20dB directivity which assures meaningful reflected power (and VSWR measurement). All three models are priced at $79. For more information, write to Hugh O'Neill, Bird Electronic Corp., 30303 Aurora Road, Cleveland (Solon) Ohio 44139, or circle C on the reader-service coupon.

Quick and Easy QRP



The QRPP station as used at K4JYM. Using Ten-Tec modules as its basis, the station is easily assembled. From left to right: the receiver, the transmitter, and the power supply/dummy load s.w.r. bridge. Addition of key and antenna completes the station.

BY ALEX M CLARKE,* K4JYM & LANCE H. STRICKLAND,† K4AUN

RECENT interest in QRP operation, as well as the possibility of having an alternate and very portable rig, lead the authors to a search for a simple way of getting several small rigs built up. The introduction of the Ten-Tec modules solved all of the parts problems, and seemed to offer the chance to customize a rig having the features we were interested in, rather than either be limited or inundated by the normal commercial package. Even though using these modules would take the project out of the "complete homebrew" category, enough room was left for self expression to make it fun, as well as solve the time problem which seems to be with us despite the 40 hour and shorter work week. The resulting rig(s) are real fun machines. The several auxiliary circuits developed can be used to modify the commercial Ten-Tec rigs or to add to the DeMaw transceiver.[1] Some of the packaging ideas may be of interest to

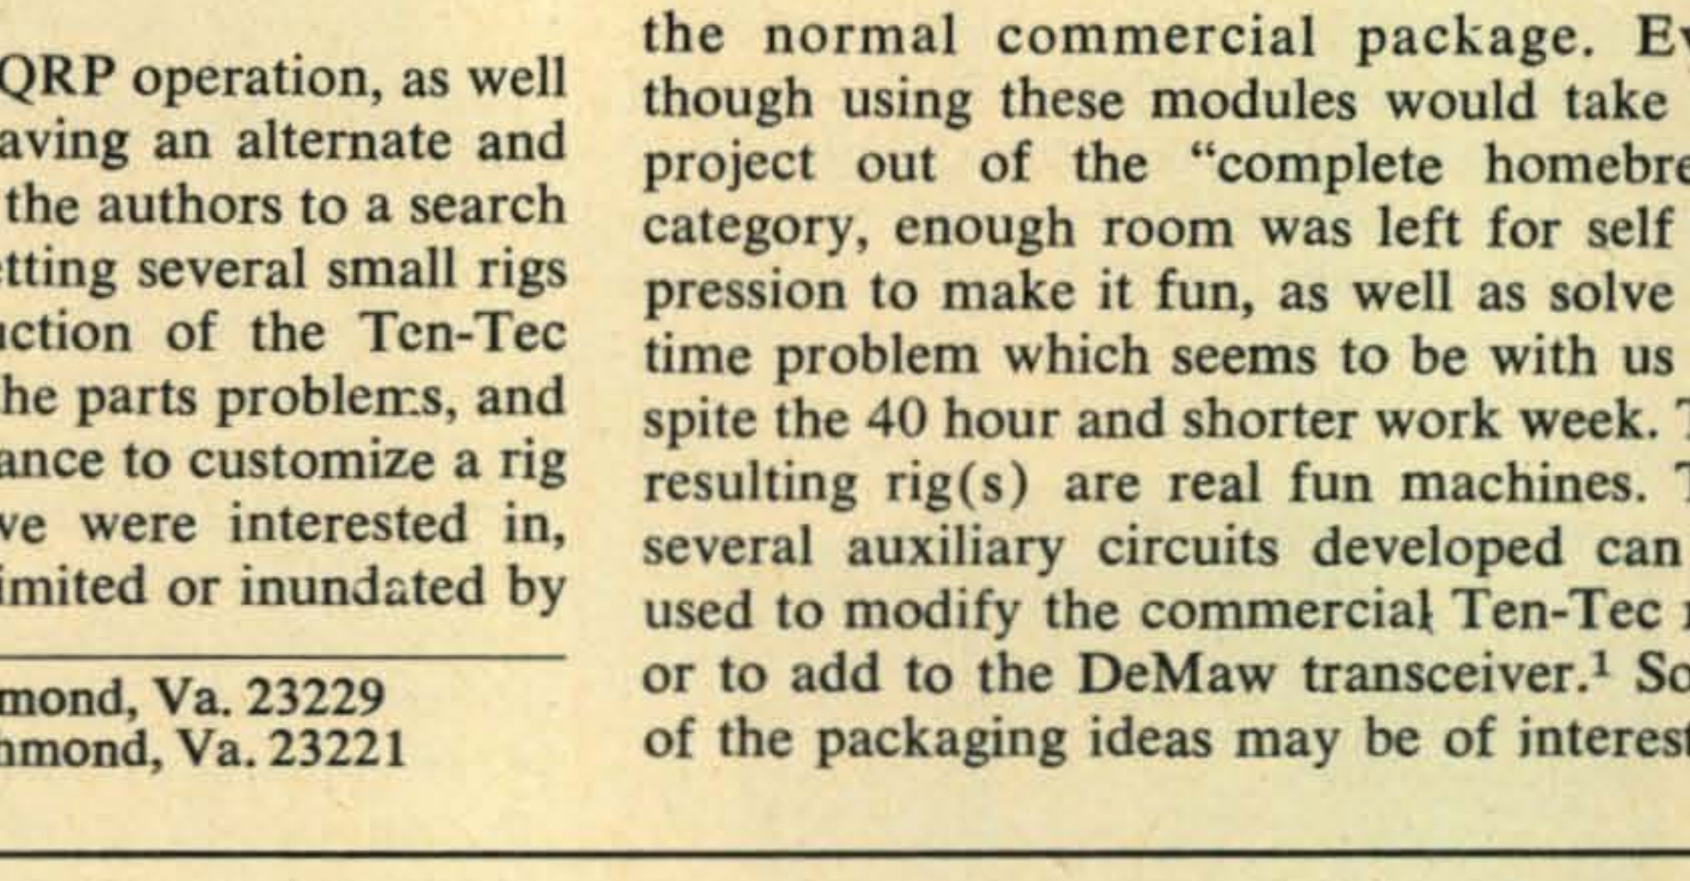

Fig. 1 — Simple v.f.o. transmitter with QSK switch for 80 and 40 m. operation. CR_1 is any small-signal diode; CR_2 is a 10v. 300 mw Zener diode; Q_1 is any PNP Silicon transistors; S_1 is a d.p.d.t. rotary switch.

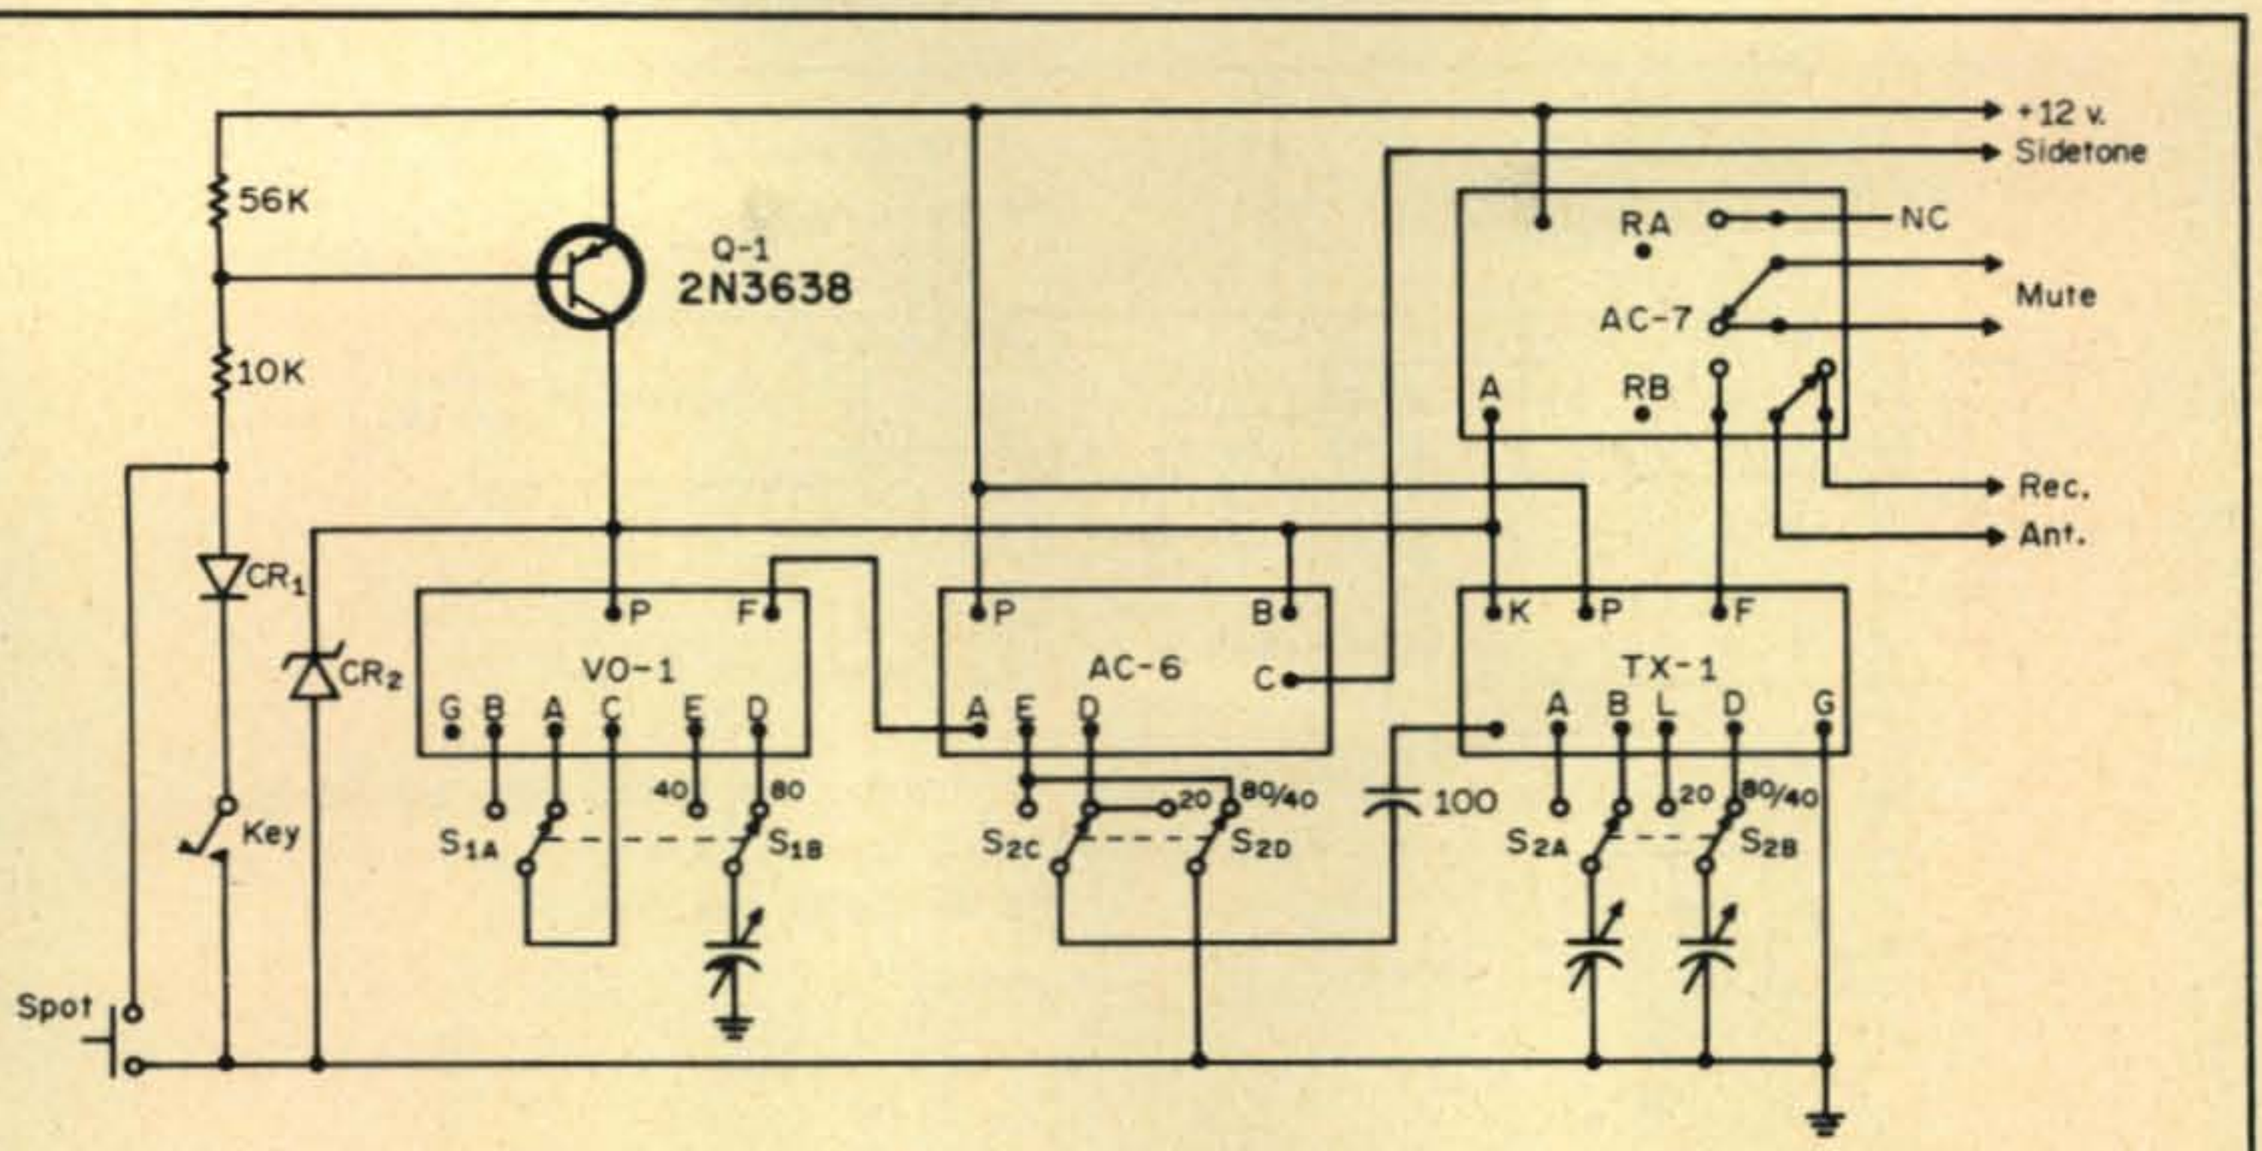

Fig. 2—Block diagram of the 80, 40 and 20 meter v.f.o. transmitter with VOX-type break-in, sidetone and mute control. S_1 is a d.p.d.t. rotary switch; S_2 is a 4 p.d.t. rotary switch.

others, but perhaps most of all, some of our mistakes could be avoided.

The Transmitters

QRP or otherwise, if full break-in operation is possible it is foolish not to use it. Both of the authors had QRO rigs capable of this type of operation, so it was a must. One of the authors was only interested in base station QRP, so his rig ended up very simple, but the other wanted a vacation rig, so some receiver control features had to be included in the second transmitter. Both 80 and 40 meters were mandatory so we could get on the air any time of the day, but 20 meters would be nice to have also. Here's how it went:

For the simplest rig, the Ten-Tec TX-1 transmitter and VO-1 v.f.o. modules were used, with hookup as suggested in the manuals supplied. A Jackson Brothers 6:1 vernier drive (available from Arrow Electronics) was used for the v.f.o. tuning, as this is by far the smoothest vernier available, as well as the cheapest. Calectro single gang 365 mmf capacitors from the local parts distributor were used for buffer and final "front panel tuning" of both 80 (max) and 40 (near min). Similar capacitors are available from Lafayette or Allied Radio Shack. A Calectro d.p.d.t. rotary switch was used to switch the v.f.o. between 80 and 40 meters. A 300 ma Calrad meter was used in the power line to the v.f.o. and transmitter stages for tuning.

The normal Ten-Tec hook-up allows the v.f.o. to run all of the time. This is not a problem if a hand-operated transmit-receive switch is used, but is murder when trying to operate QSK. Keying the whole supply was tried, but the sparking at 200 to 300 ma seemed to make this a bit crude, as well as clicky, particularly since Ten-Tec has included such a convenient way of getting around keying the final. Why not switch the v.f.o. on and off with the key? The circuit used is shown in fig. 1. Because the VO-1 seems to put out more than enough power at 9 volts to drive the transmitter module, a 10 volt Zener (CR_2) was put from the "P" terminal on the VO-1 to ground (Q_1, the transistor switch, serves as the dropping resistor). This helps considerably with the oscillator "pulling" problem. A blocking diode in the switch circuit allows the v.f.o. alone to be turned on for spotting.

The second transmitter, fig. 2, added 20 meters, sidetone, and VOX-type semi-break-in. At first 20 meter operation was attempted using doubling direct from the v.f.o., with another d.p.d.t. rotary switch used to switch both the buffer and final tank circuit taps. Unfortunately, resonance at 20, 15, and maybe 10 was also possible, so this operation mode was not feasible, it was just too hard to decide which harmonic of the 7 MHz v.f.o. was being amplified. Ten-Tec suggests a circuit for 20 and 15 meter operation in their MR-1 kit manual, but they also offer an AC-8 20 meter isolation-doubler stage (and also

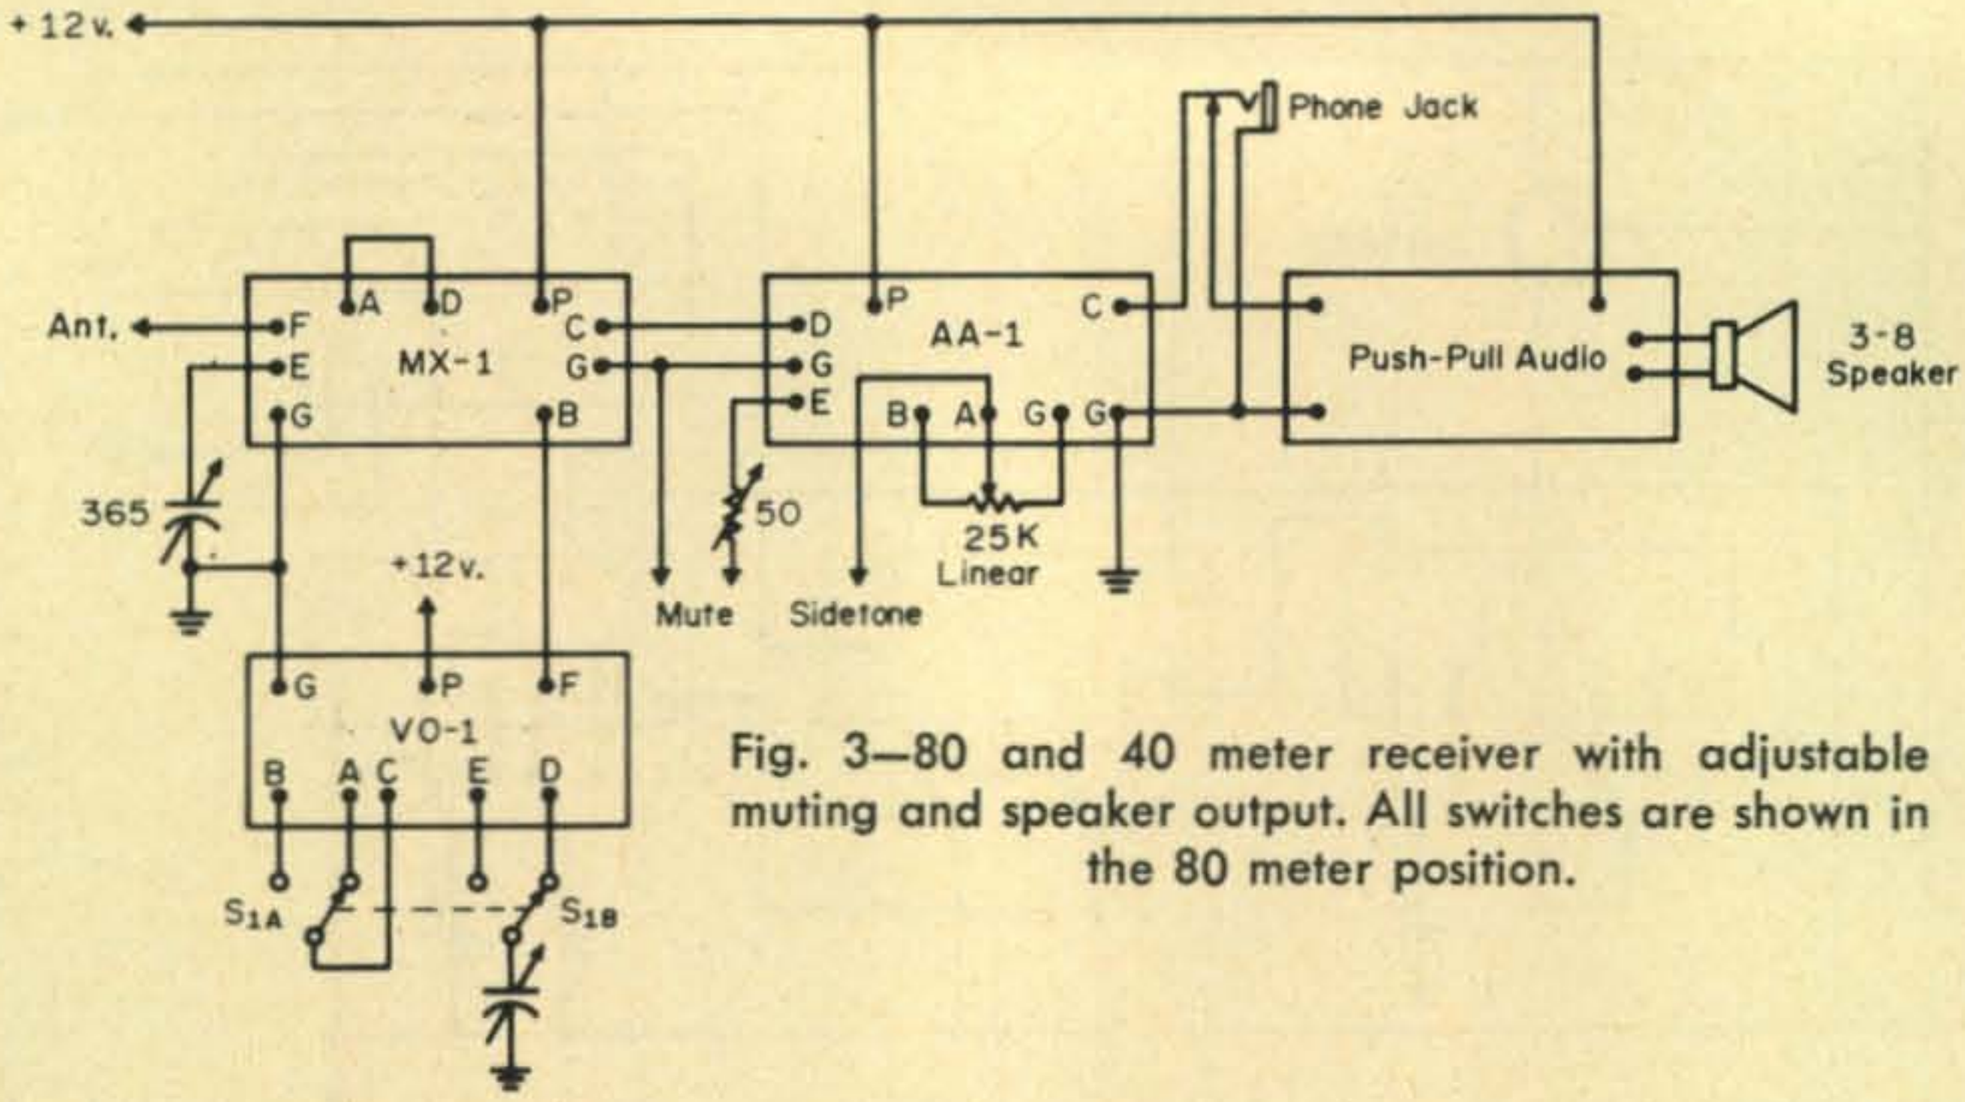

Fig. 3—80 and 40 meter receiver with adjustable muting and speaker output. All switches are shown in the 80 meter position.

an AC-6 isolation-doubler stage plus sidetone). Since at this time a receiver was also being built, the AC-6 was used. To avoid too many switches (actually, only one need be used, but this complicates the packaging) the d.p.d.t. bandswitch originally used for 80/40—20/15 operation of the TX-1 was replaced by a 4 p.d.t. Calectro switch, the extra two sections being used to cut the 20 meter module in and out as called for in the AC-6 instructions. The AC-6—AC-8 module also provides, the 80/40 meter position, an extra stage of v.f.o. isolation—well worth the addition.

After taking this outfit on the first trip, and several times "transmitting" with the rig in the receive position, the VOX type antenna transfer module was added (AC-7—slightly modified).

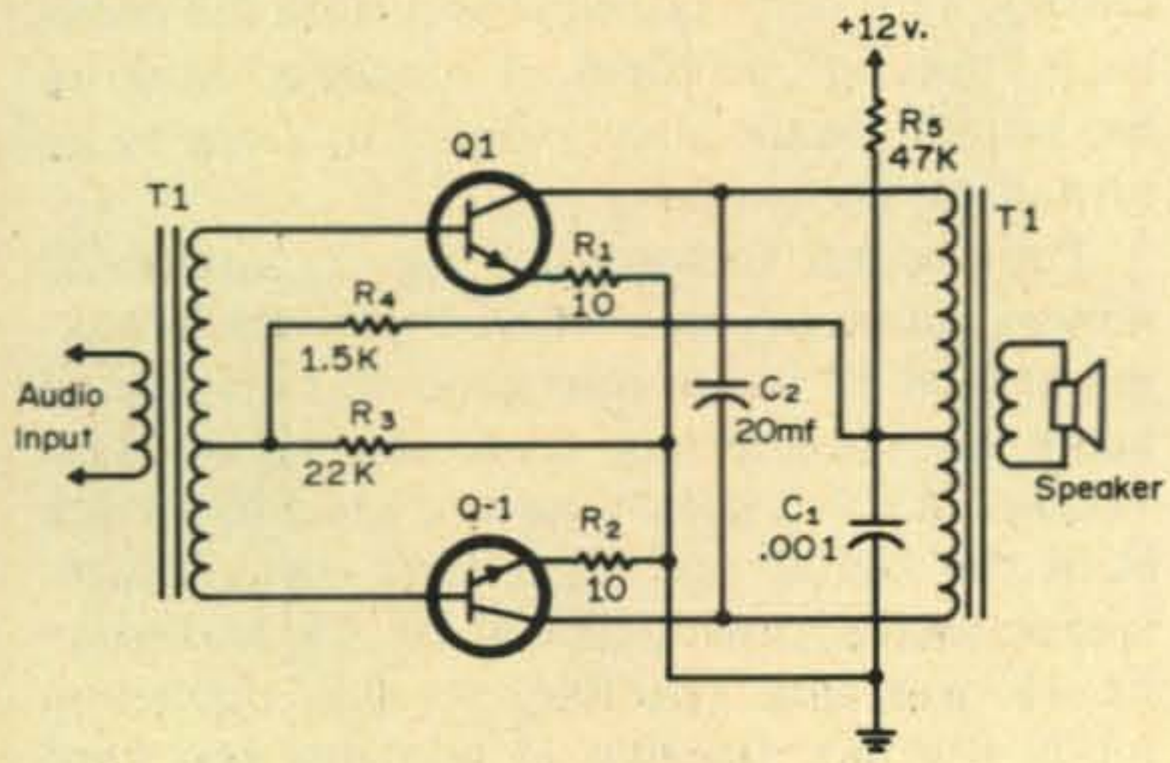

Fig. 4—Push-pull audio output stage able to drive a speaker. Q_1 and Q_2 are 2N3641 or similar. T_1 is a 1200 ohm to 1200 ohm audio input transformer (Calectro D1-724); T^2 is a 1200 ohms to 8 ohms (Calectro D1-722).

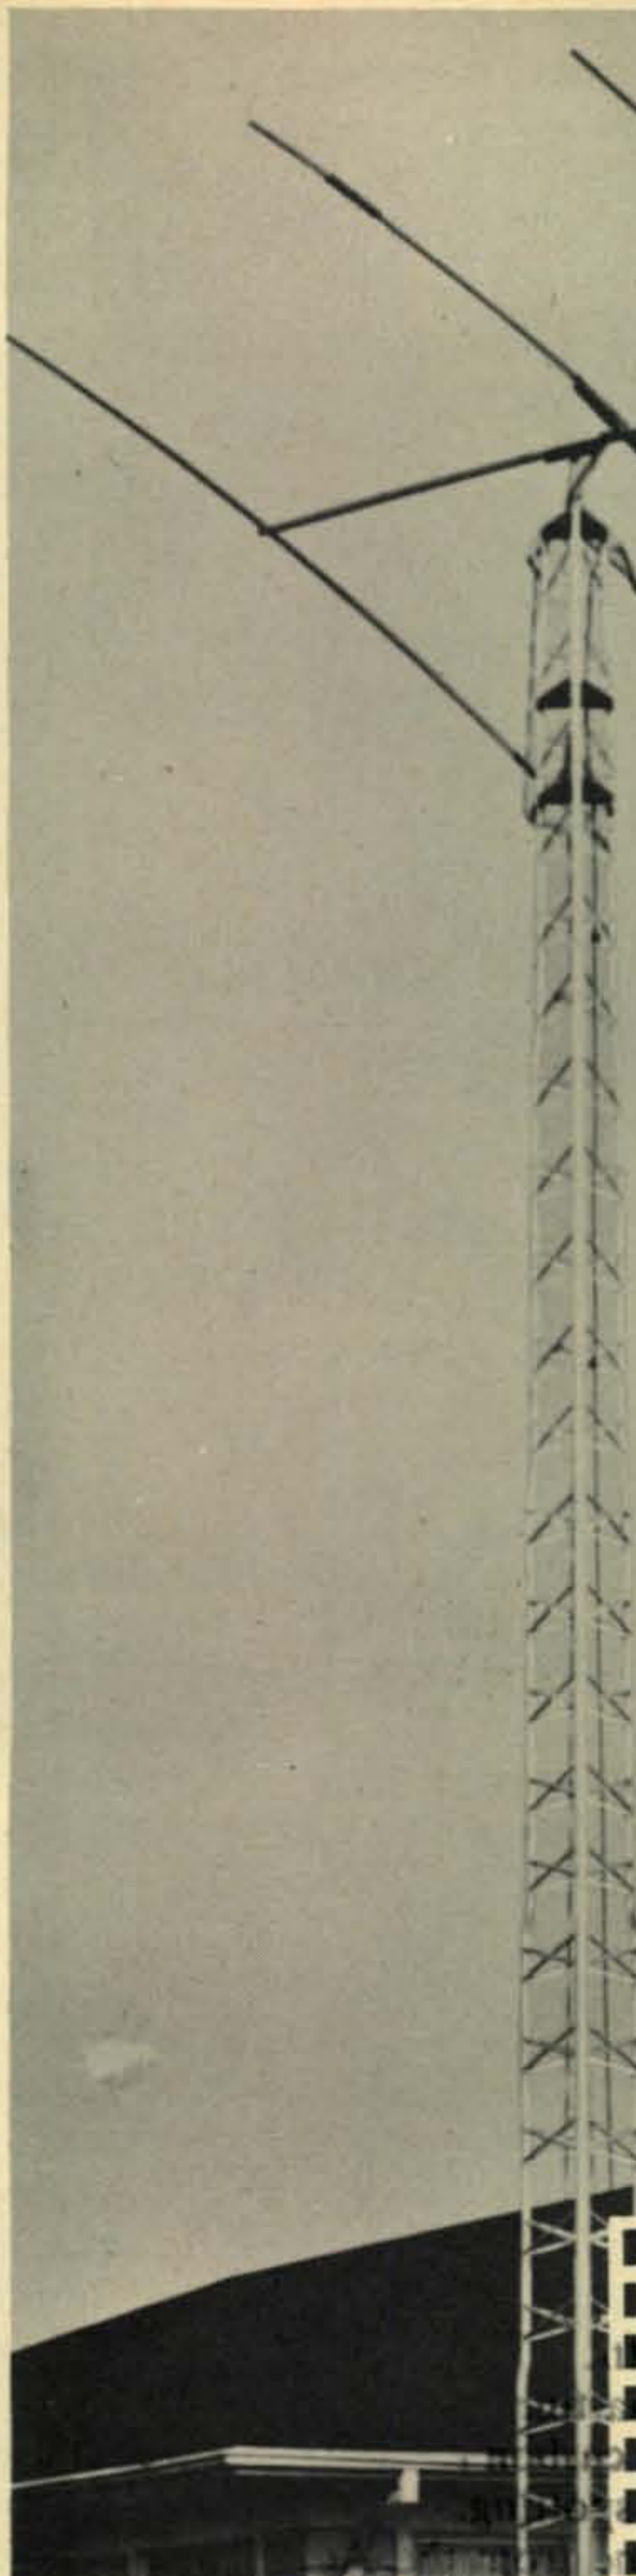
The Receiver

Meanwhile, a matching receiver, fig. 3, was built in a separate enclosure using the VO-1, AA-1, and MX-1 modules, again with the Jackson vernier dial for the v.f.o., the Calectro 365 mmf variable for preselector (MX-1) tuning, and the d.p.d.t. rotary switch on the VO-1 for band switching between 80 and 40 meters. A 25 K *linear* pot is needed for a volume control. This makes a receiver very much like DeMaw's DC 80-10 job[2], or the receiver section of his later QRP transceiver. The headphone problem (forgetting them) prompted including a speaker. Although the AA-1 would drive a speaker when matched through a 1200 ohm to 8 ohm transistor output transformer (Calrad, Calectro, Lafayette, etc.), we wanted more volume. Figure 4 shows the schematic for a simple transformer coupled push pull class B audio "power" stage. The R_DC_D decoupling net is absolutely necessary, and the capacitor across the collectors was needed to cut out a high pitched audio howl. The amplifier idles at 3 ma, and only draws 25 ma at ear splitting volume. A vectorboard bread board with old Sub-ouncer transformers was built, as well as a printed circuit version. Both worked well, but it was found that magnetic coupling between the output transformer in the P.C. version and the AA-1 audio module caused feedback problems. The Vectorboard version worked all right when shielded and thus was used, but had the enclosure design allowed placing either power stage in a more remote position, the trouble would not have appeared (it did



COMPLETE PACKAGED TOWERS *from* ROHN®-SPAULDING

Designed and Engineered for the Ham–CB–Experimenter

- *4 Rohn-Spaulding models from which to choose* depending on antenna—equipment load. Available in heights up to 64' self-supporting. Other ROHN models available to several hundred feet.
- Rohn-Spaulding manufactured "Beaded Channel Leg" and all riveted construction produces a tower of maximum strength. Rohn-Spaulding mass production techniques keep your cost low —quality the highest.
- Patented tapering sections go up fast.
- Tower, base and accessories galvanized for attractiveness and long life.

not until the boards were mounted in the cabinet). Additionally, the particular speaker originally used also caused magnetic coupling effects. An external speaker could be used with no feedback problems, but this defeated the reason for the inclusion of the speaker in the cabinet. A smaller speaker took care of the matter, but had we been able to put the speaker in the "correct" place away from the input to the high gain audio module, the problem would not have arisen. No provision was provided to cut the power on the audio amplifier, except to use a circuit-interrupt jack for headphones, such that the audio stage is not driven when the "cans" are plugged in.

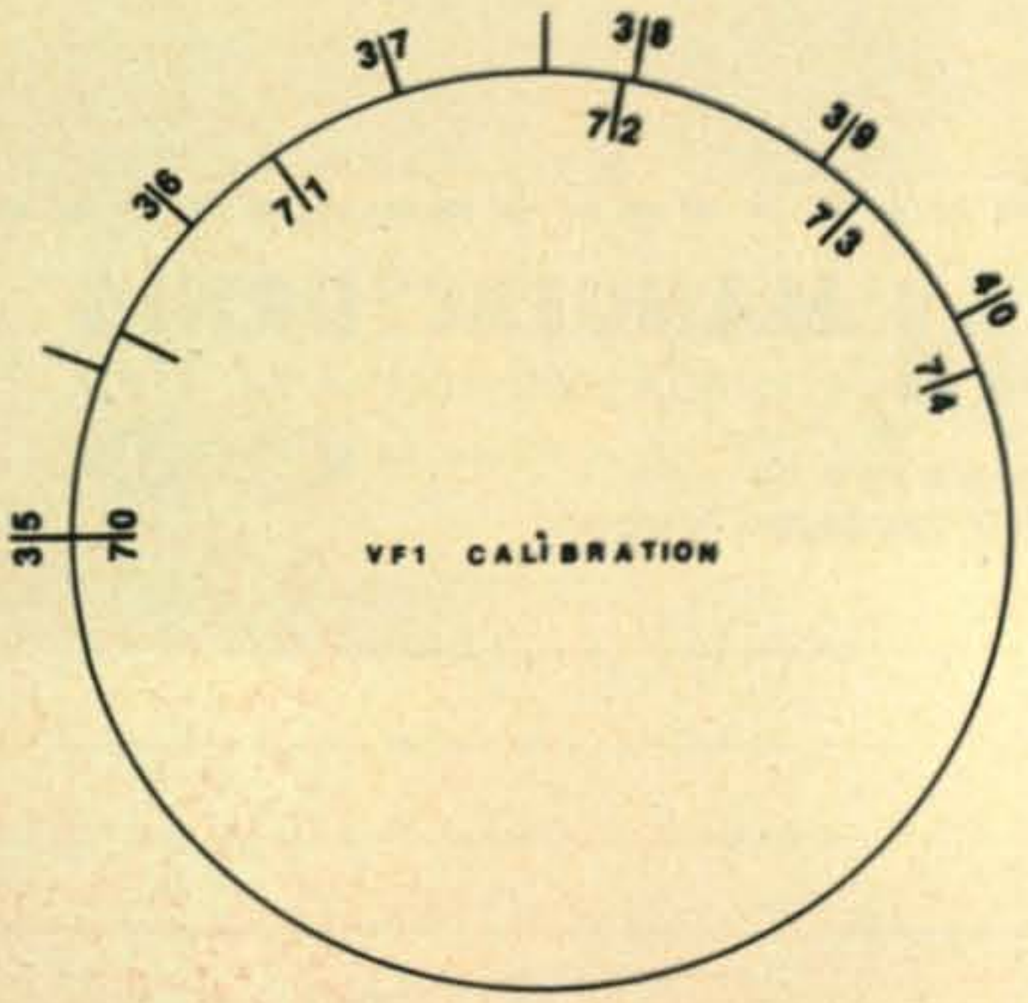

Fig. 5—Actual size calibration scale for the Ten-Tec VF-1 v.f.o. tuning capacitor.

The mute and sidetone circuit modifications deserve a word. The mute circuit in the AC-7 VOX changeover shorts out the input of the AA-1 audio module when hooked up as recommended. This so thoroughly cuts out any signal getting through to the audio module that it is not possible to monitor the transmitter with the receiver. By placing a a 50 ohm pot in series with the muting lead, the spotting or monitor signal level can be varied from completely muted to very loud. Note that spotting, in this case, is done by keying the whole transmitter. So as not to swish across the band, a lever switch in front of the antenna tuner is used to switch in a 2 watt, 50 ohm carbon resistor dummy load for tune up and spotting.

The sidetone from the AC-6 was found to be weaker than we thought useful when hooked directly across the audio gain control as recommended by Ten-Tec. Taking a hint from the Heath sidetone circuit, the audio output was hooked directly onto the wiper arm of the volume control, making the volume relatively constant at whatever level is

E&E guides hams through radio's mysteries.

Highly popular Editors and Engineers books from Sams give amateurs everything they need to know about radio operation and technology. They're authoritative, clear and easy to follow. You'll want them for your library.

Famous E&E RADIO HANDBOOK—18th Edition
By William I. Orr, W6SAI

The completely updated electronics industry standard for engineers, technicians and advanced amateurs. Shows how to design and build all types of radiocommunications equipment. Includes ssb design and equipment, RTTY circuits, latest semiconductor circuits, IC's, special circuitry **No. 24020—$13.50**

SINGLE SIDEBAND: THEORY & PRACTICE
By Harry D. Hooton, W6TYH

A basic text, covering origin of ssb, derivation of signals, sideband selection, ssb generators, carrier-suppression techniques, carrier generators, speech amplifiers and filters, balanced mixers and converters, low-power ssb transmitters, linear r-f power amplifiers, much more. 388 pgs., hard cover. **No. 24014—$6.95**

SEMICONDUCTOR AMATEUR PROJECTS
By Louis M. Dezettel, W5REZ

For the ham who still takes pride in using his hands and head, here are projects for 16 useful, money-saving accessories, using easy-to-build semiconductor circuitry. Units are for measuring equipment, adding power and convenience, converters, etc. **No. 24025—$4.95**

AMATEUR RADIO INCENTIVE LICENSING STUDY GUIDE
By Robert M. Brown, K2ZSQ and Tom Kneitel, K2AES

Invaluable aid for the amateur license applicant Clear, fully detailed, complete. **No. 24004—$3.25**

SOLID-STATE QRP PROJECTS
By Edward M. Noll, W3FQJ

By building QRP equipment you learn solid-state technology, since these rigs include transistors and/or integrated circuits The low-cost units described have power ratings from less than 100 milliwatts up to about 20 watts. Both cw and phone rigs are included. **No. 24024—$4.25**

73 DIPOLE AND LONG-WIRE ANTENNAS
By Edward M. Noll, W3FQJ

Detailed construction data for 73 different types of wire antennas. Appendices describe construction of noise bridges, line tuners, data on measuring resonant frequency, velocity factor, and SWR. **No. 24006—$4.50**

73 VERTICAL, BEAM, AND TRIANGLE ANTENNAS
By Edward M. Noll, W3FQJ

Design and construction of 73 different antennas used by amateurs, each built and air-tested by the author. Also construction of noise bridges and transmission-line tuners, measurement methods. **No. 24021—$4.95**

ELECTRONICS FOR THE AMATEUR
By Louis M. Dezettel, W5REZ

Covers radio-wave propagation as it applies to amateur band frequencies, reception and transmission pertaining to ham equipment, and the special field of antennas and how to feed them. Gives you everything needed to pass the theory sections of the FCC exams. **No. 24022—$7.95**

RADIO AMATEUR'S F-M REPEATER HANDBOOK
By Ken W. Sessions, Jr., K6MVH

The definitive work on amateur f-m repeaters. Includes: Preparing and obtaining sites for repeaters; How to build a repeater; Repeater applications; an f-m repeater directory. **No. 24008—$6.95**

AMATEUR TESTS AND MEASUREMENTS
By Louis M. Dezettel, W5REZ

Shows how to accomplish virtually all performance tests on amateur transmitters, receivers and antennas . . and how to make required adjustments. **No. 24007—$5.50**

HAM AND CB ANTENNA DIMENSION CHARTS
By Edward M. Noll, W3FQJ

Tabulates dimension data in feet and inches for all popular antenna configurations With them, an antenna can be dimensioned for a specific frequency range according to license class and mode of operation. **No. 24023—$1.95**

Order from your electronic parts distributor or send coupon below.

...the world's most complete line of advanced VHF fm equipment

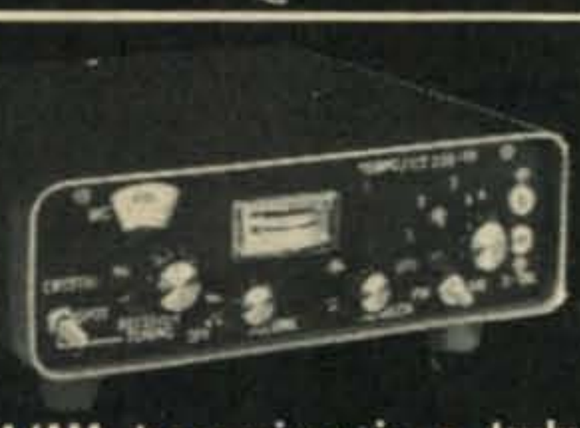
TEMPO /fmv

A true value in 2 meter FM, the Tempo fmv is the father of the Tempo VHF line. This small package offers operation at 12 volts, or with the accessory power supply, at 110 volts, for 10 watts output. An unmatched design at any price, the fmv offers high quality and top performance at a reasonable cost. The Tempo fmv . . . $245.00

TEMPO /fma

The Tempo fma is the top of the Tempo VHF line. This transceiver offers all of the famous Tempo quality and performance at 25 watts of power output. The unit also features a low power position for 10 watts output to conserve battery power. Here is a true value. . . $345.00

TEMPO CT220 TR



The Tempo CT220 TR FM/AM transceiver is a truly unique, top quality little giant offering features never before offered in any unit at this price.

TEMPO /fmp

Truly mobile, the Tempo fmp-3 watt portable gives amateurs 3 watts, or a battery saving ½ watt, FM talk power anyplace at anytime. With a leather carrying case included, this little transceiver will operate in the field, in a car, or at home with an accessory AC power supply. The battery pack is of course included only $221.00

TEMPO CT HI-POWER AMPLIFIERS

Tempo also offers a full line of 2 meter FM amplifiers for mobile or base station operation. Output ranges from 25 to 120 watts for drive power of 1, 5, or 10 watts. Tempo CT1002 10/120 VHF Amplifier $220. Tempo CT802 10/80 VHF Amplifier $160 Tempo CT252A 1/25 VHF Amplifier $85. Plus six other amplifiers

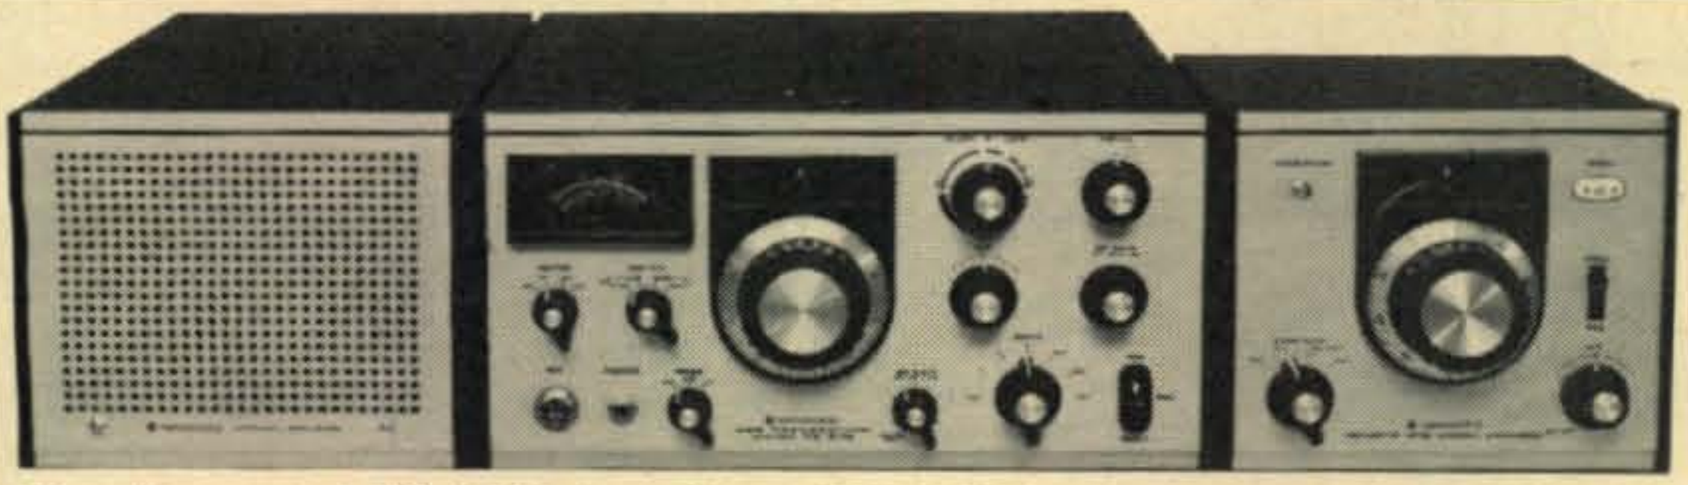
a winning pair....the "Kenwood twins"

THE MOST EXCITING RECEIVER AND TRANSCEIVER TO ENTER THE AMATEUR SCENE IN RECENT YEARS. THE KENWOOD R-599 SOLID STATE RECEIVER AND T-599 HYBRID TRANSMITTER HAVE ESTABLISHED NEW STANDARDS OF PERFORMANCE, RELIABILITY, FLEXIBILITY, STYLING AND VALUE.

THE R-599 RECEIVER: .5 microvolt sensitivity (amateur bands 1.8-21.0 MHz) • Dial readout to ½ kilocycle • Special detectors for SSB, AM, and FM • Transceive operation with T-599 • Built-in 100 kc and 25 kc crystal calibrator • Built-in 500 cycle CW filter • Provision for two meter and six meter coverage with optional accessory self-contained converters • Advanced "Space-Age" styling • Adjustable threshold squelch • The price . . . only $329.00*

THE T-599 TRANSMITTER: Clear, stable, selectable side-band, AM and CW • 4-way VFO Flexibility plus Receiver Incremental Tuning (RIT) when used with the R-599 • Amplified ALC • Built-in VOX • Full metering, including cathode current, plate voltage, ALC and relative Power Output • Built-in CW Sidetone monitor and semi-automatic break-in CW • Built-in power supply • Maximum TVI protection • Employs only 3 vacuum tubes • The price . . . only $365.00*



THE KENWOOD **TS-511S** TRANSCEIVER

The Kenwood TS-511S is a five band SSB and CW transceiver packed with power and performance . . . offering features never before available in its price range. For example: built-in VOX, crystal calibrator, noise blanker, receiver incremental tuning, 1 kHz frequency readout, 8 pole filter, stable FET VFO, dual conversion and accessory CW filter.

FREQUENCY RANGE:
80 meter band 3.5 - 4.1 mHz
40 meter band 7.0 - 7.6 mHz
20 meter band 14.0 - 14.6 mHz
15 meter band 21.0 - 21.6 mHz
10 meter band 28.0 - 28.6 mHz
28.5 - 29.1 mHz
29.1 - 29.7 mHz

MODES: LSB, USB, CW

INPUT POWER:
500 watts PEP, 300 watts CW nominal.

SENSITIVITY:
3.5-21.6 mHz band; 0.5 uv S/N 10 db
28.0-29.7 mHz band; 1.5 uv S/N 10 db and less than 100 cps frequency drift per 30 minutes after warm-up

SELECTIVITY:
SSB more than 2.4 KC (at 6 db) with 2 to 1 slope ratio
CW more than 0.5 KC (at 6 db)

AUDIO OUTPUT: more than 1 watt (10% distortion)

TUBE & SOLID STATE COMPONENTS:
10 Tubes, 1 IC, 37 Transistors, 4 FET, 52 Diodes

PRICE: $398.00

ACCESSORIES:
Power Supply with built-in speaker $105.00
External VFO $99.00
CW Filter $35.00

**Prices subject to import surcharge*

F. M.

BY GLEN E. ZOOK,* K9STH/5

ONE year ago this month *CQ* formally recognized the rapidly growing trend towards f.m. operation. This recognition, of course, was the inclusion of this column as a regular portion of each issue. The first year's columns concentrated on getting the repeater going and keeping the various equipment used by individual amateurs in tip-top shape (test equipment, *etc.*). The lion's share of attention has been given to the two meter activity. This is only proper, for most of the amateur f.m. activity is presently on two meters. W2JTP and myself have been trying to promote activity on the 220 MHz band through simple, but effective, modifications to high-band equipment. This band, as well as the other v.h.f. and u.h.f. bands need population by amateurs to keep the frequencies.

*818 Brentwood Lane, Richardson, Texas 75080

Fig. 1—A 220 MHz final amplifier stage. Use a g.d.o. as a different layout will have an effect. The output of the prototype was 20 watts with 450 v.d.c. on the plates.

L_2—2 t. #12, ¾" d., spaced ½", 1 turn link to side.

During the first year changes in the make-up of the average repeater user have become evident. The off-the-shelf two meter f.m. rig has brought many amateurs onto the local and national f.m. scene. An editorial in the October issue of the bulletin published by the Miami Valley F.M. Association (Dayton, Ohio) does an excellent job of presenting the picture of f.m. as we now approach repeater saturation in some areas. Just substitute the name of your town for Dayton, and the names of neighboring towns where mentioned, and put in local FM frequencies where needed. Sounds just like your town, doesn't it?!!

One Man's Opinion

Isn't it great to cruise the streets of Dayton, or sit at home listening to '76. We get to hear all the chatter from Cincinnati and from Columbus: Sometimes we get lucky and also hear Fort Wayne, Newcomerstown, and several others all at the same time. And isn't it great to be working from your mobile in the Dayton Area and get clobbered by the Cincinnati or Columbus Repeater? Who are we benefiting by staying on this "accepted" 34-76 (*editors note: and .34-.94*) frequency combination. The infrequent out of town visitor who is able to raise someone while zipping thru Dayton? Perhaps its time to stop catering to the very small minority, and switch to a frequency that will benefit all of our members. Most of us used to monitor 76 constantly at home and in the car. Then we found it hard to "stomach" all the garbage coming in at home on our sensitive receivers. Now, its very difficult to monitor at all! Tone burst does not seem to be much of an answer. It saves wear and tear on our repeater, but does not stop the other repeaters from coming thru.

It's obvious that "Changing Times" are catching up with us. We no longer have our own little party line repeater. Its also obvious that we can not preserve "old times." If conditions change, we are going to have to change with them. F.m. and particularly repeater operation still presents the most challenging and rewarding mode of amateur radio to come along in a long time. Lets talk it over, make decisions and "get with it."

There are many sources of thought in this editorial (unsigned, by the way). Repeaters on 34-94 or 34-76 are fine, but do all in an area have to be on these frequencies? By using narrowband techniques there are 13 repeater input channels between 146 and 147 MHz with space in the middle for direct activity. Then, by going to the 15 kHz channel spacing as has done the commercial services (using the same narrowband equipment as with 30 kHz spacings), the number of channels can be doubled. Sure, its beneficial to the travelling amateur to have a repeater on the standard pairs, and probably the first repeater in a given area should go on the standard 34-94

or 34-76 pairs. However successive repeaters within the usual range of the first repeater should then go to one of the other recognized repeater pairings. Coordination of these frequencies is accomplished in many areas through cooperation. Keep the national calling channels covered, but not swamped.

Gee, I'll bet that you didn't expect such a long editorial for the 1st anniversary! Enough opinions for a while.

Technical Talk

This first anniversary Technical Talk will cover several items, including the 5894 final amplifier stage mentioned last month for 220 MHz, use of the Sentry solid-state oscillator decks for adding two or more frequency capabilities to receivers (transmitters next month), a solid-state COR, and other goodies.

220 MHz Final

The modification of the Motorola "G" transmitter to the 220 MHz band (alon with the Sensicon "A" receiver) was covered last month. The output of the final amplifier in the "G" transmitter to the 220 MHz band (along with the Sens- substitution of a 2E26 (see last month why) in the output stage. This low power is sufficient for local work, but a bit more power is often helpful. By adding a 5894 final amplifier the power output can be easily raised to 20 to 30 watts or more. The amplifier used in the K9STH (in Dallas WA-5STI) 220 MHz rig was based on the 2 meter amplifier in the *RSGB VHF MANUAL* (with a little help from the *ARRL VHF Manual*). The grid is tuned, the screen neutralized, and the entire amplifier is very stable. As in any v.h.f. construction a g.d.o. is a must. The data on the coils is taken from the amplifier presently in use. However, minor differences in layout at these frequencies can effect changes on the resonant frequencies. Therefore, each coil should be checked with a g.d.o. Also, the screen neutralizing capacitor must be adjusted for maximum output and no take off. In the prototype amplifier the 5894 would not self oscillate, but would shut itself down when not neutralized! This project is definitely not a first attempt, but many f.m.'ers have built before.

The amplifier was constructed in an LMB box which fit the space on the "T" bracket used to mount the transmitter in the rack (from a defunct T51). However, this box is quite compact after mounting the 5894. In fact, only by using a replacement assembly for a Motrac final amplifier tube (U71LHT version) would the amplifier fit into the box. However, this compact construction is not required, and a larger enclosure can be used. Just make sure to bypass and shield the entire amplifier.

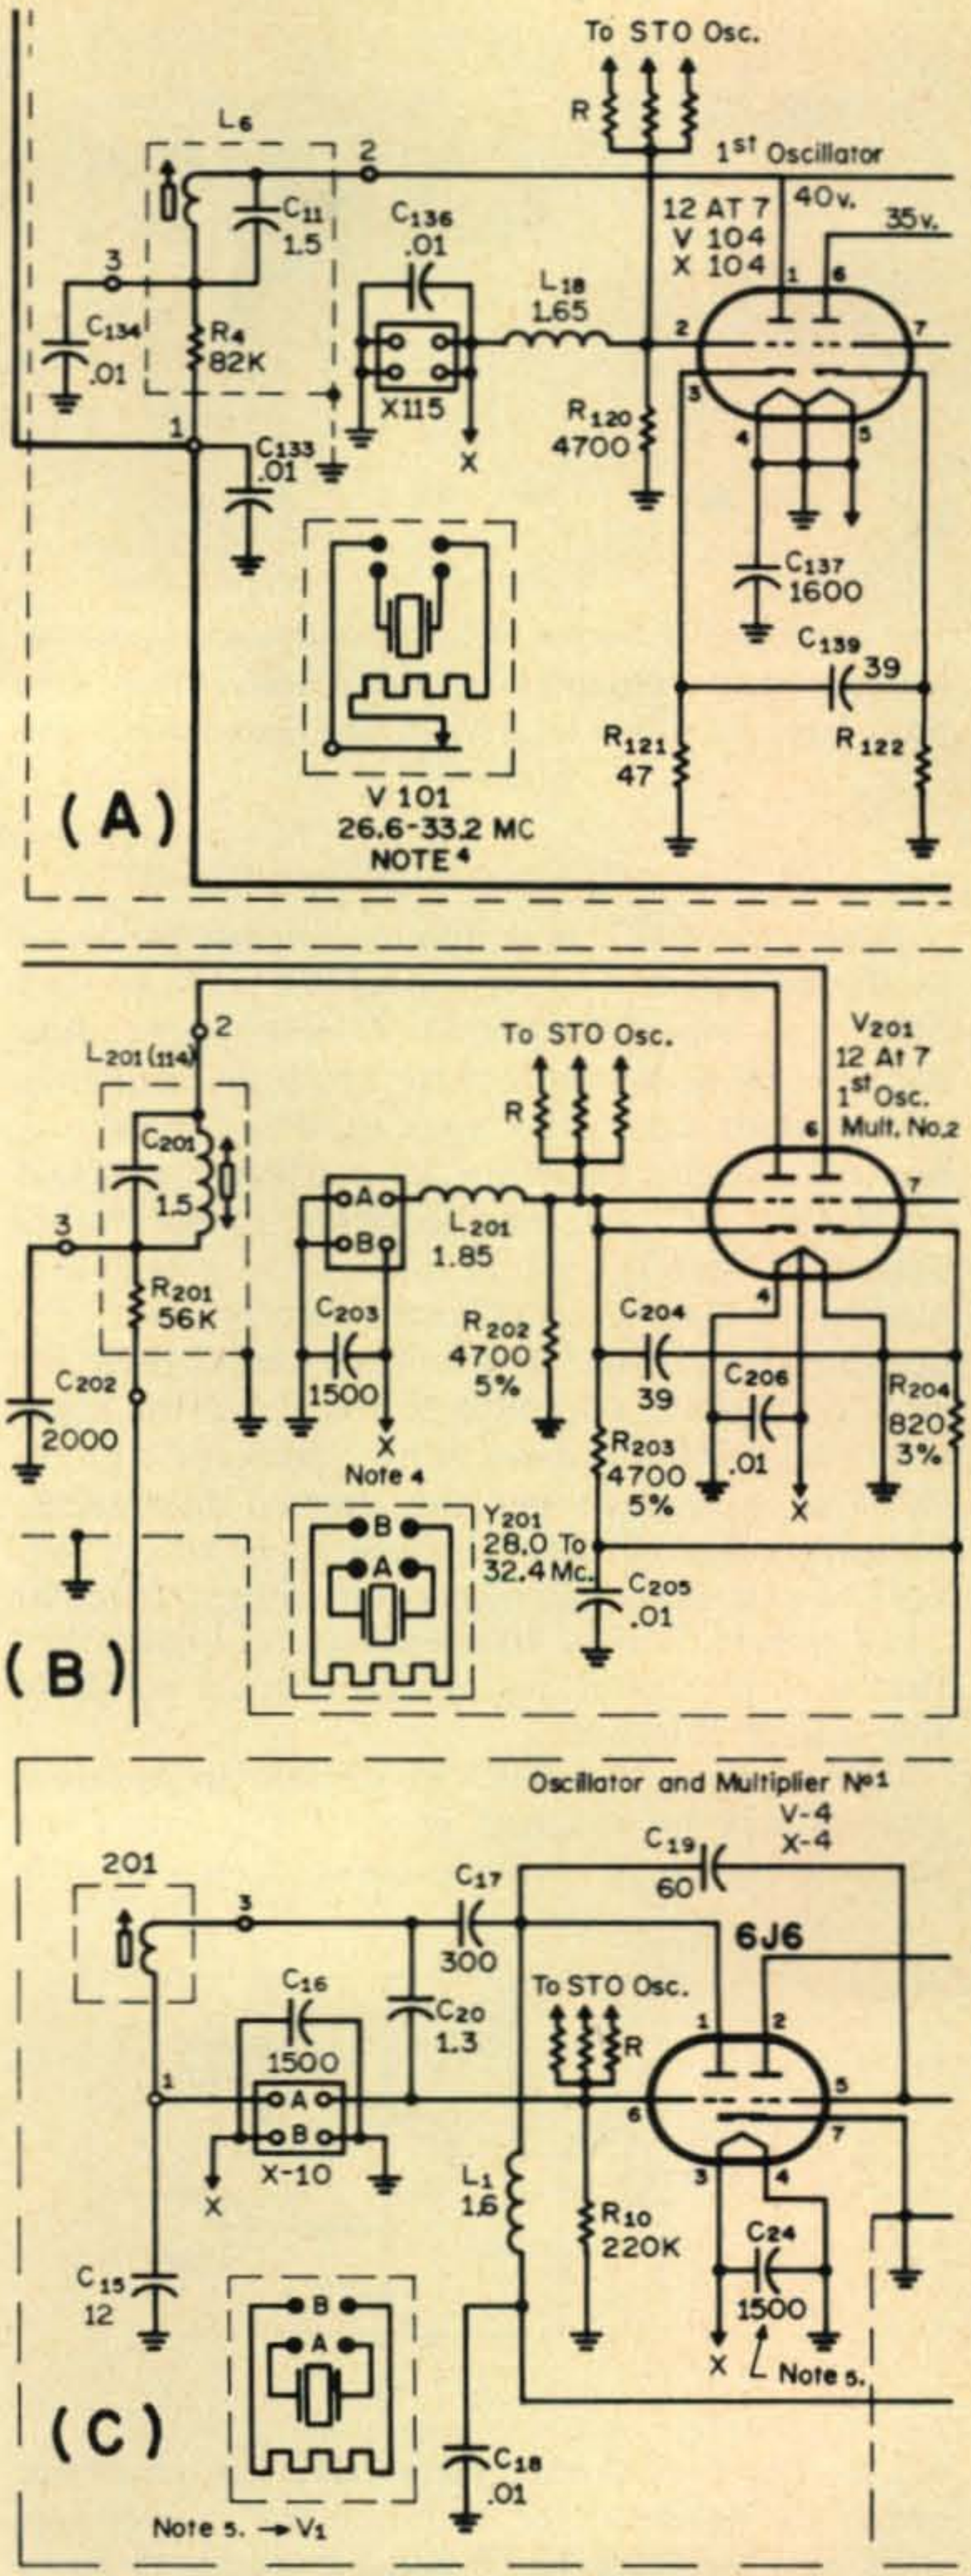

Fig. 2—(A) The Motorola "Uni-Channel" was tried with the Sentry STO osc. using 33 ohms at R. This may have to be increased with more than two oscillators. (B) Connections of the Sentry STO ocillators to the Motorola "Sensicon G." See text and (A) for discussion of "R". (C) Connections of the STO series to the Motorola "Sensicon A".

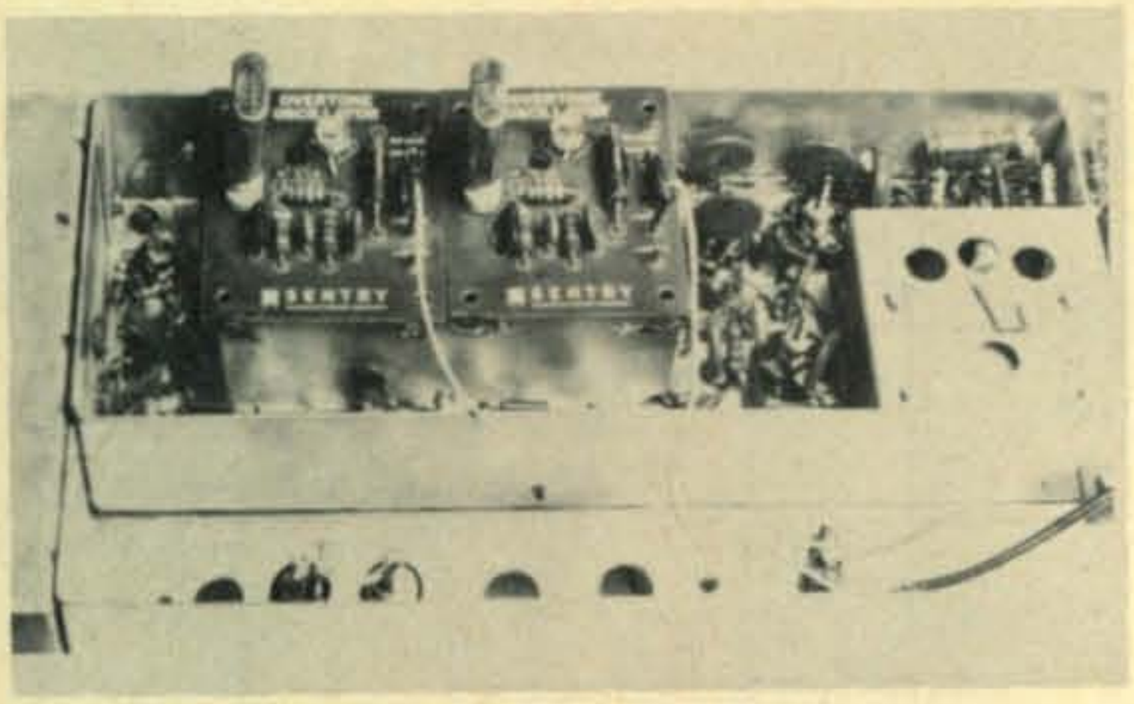

The Sentry STO Series Oscillators are excellent for adding multi-frequency to older units. Here they have been installed on a Motorola high-band "Uni-Channel".

Multiple Frequency Assemblies

Sentry Crystal is now manufacturing transistor oscillator circuits which cover 70 kHz to 165 MHz (in various ranges). These asssemblies seemed just about perfect for multiple frequency operation of older tube-type f.m. gear. Therefore, two each of the fundamental oscillators (STO-3 @ $5.00) and two of the overtone oscillators (20-40 MHz, STO-30, @ $7.50) and proper frequency crystals were obtained. Sentry spec's the oscillators at 0.0035% when used with their SC or SGP crystals. Although this is not to the usual 0.001 or 0.0005% expected by amateur f.m.'ers there is a way to get the desired tolerances. Simply order the higher priced types of crystals desired and specify for operation in the particular STO circuit. Sentry has assured this columnist that with the better crystals the circuis will hold the desired tolerance.

The use of the STO-30 circuit in receiver circuits will be touched upon this month. The transmitter circuits will be covered next month.

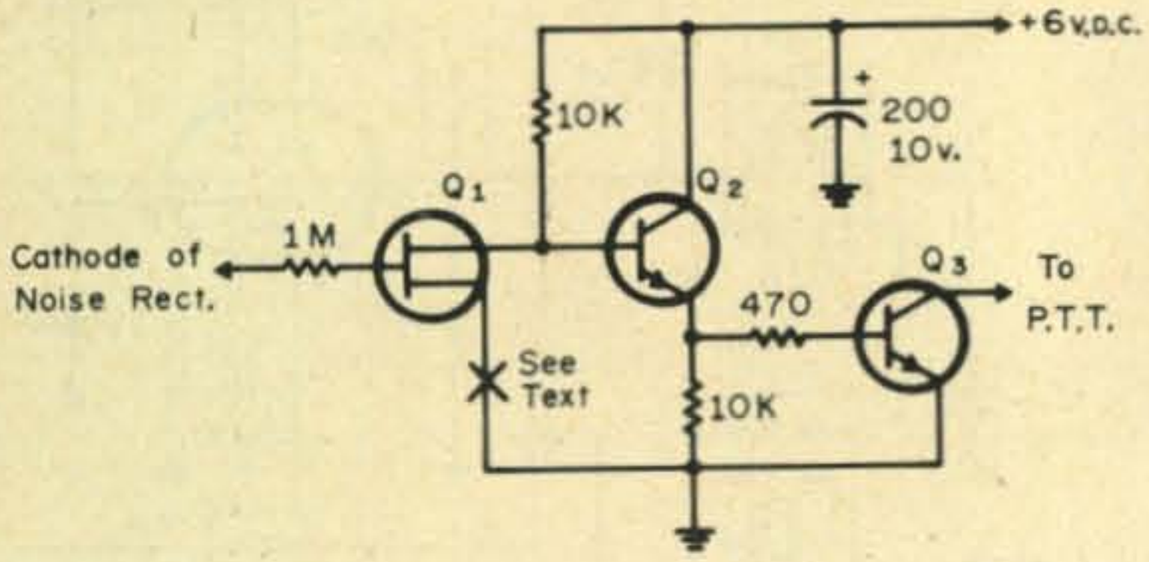

Fig. 3—The K5FOG solid state COR. The circuit was originally designed for Motorola a.c. power supplies and receivers, but it can be used with many other systems. Resistance may have to be added at "X" when used with other than Motorola units.

Q_1—HEP801
Q_2—Cheap NPN switching (2N2222, etc.)
Q_3—Cheap NPN power.

The sample units were tried in an old Motorola high-band "Uni-Channel" which, at one time, was the author's primary single-frequency base receiver for two meters. The original plan was to modify the existing oscillator circuit to act as a buffer stage rather than as an oscillator. However, there was no need to make any electrical modifications to the 12AT7. Changing the grid resistor value did not help or hinder performance. Therefore, it seems best to leave well enough alone, and just feed the output of the circuit into the grid of the former oscillator tube. The output of the STO is capacitor coupled. However, when using two or more of the STO units with the outputs in parallel a series resistor must be added to isolate each stage. This is quite common in newer equipment like the Motorola U73MHT-3190 series with four channel elements. In the case of the STO units they can be considered as "channel elements." With only two oscillators 33 ohms was sufficient, but with more oscillators this will probably have to go up to about 150 ohms.

The voltage requirements for the STO-30 oscillators is 9-12 v.d.c. @ 10 ma. maximum. In negative ground mobile units this can be obtained from the battery or primary input voltage. However, for base stations and for other mobiles using either 6 volt automotive systems or positive ground systems another approach must be taken. By the way, this also works fine with 12 volt negative ground systems. Borrowing a trick from the hi-fi manufacturers we can easily obtain the proper operating voltage from the cathode of the audio output tube. This is usually a 6AQ5, 6V6, or similar characteristic tube. The cathode is usually from 9 to 11 volts above ground. Also, this point is usually well filtered. Therefore, we can tap the cathode for proper operating voltage for the STO oscillator. This voltage is switched from oscillator to oscillator to change channels.

In the test receiver the oscillator meter reading (position 6) was only about 1/2 that when using the 12AT7 as an oscillator. However, the injection was sufficient to easily meet the original specifications. In fact, the 20 db quieting point was slightly under 0.3 microvolts. Not too bad for a 20 year old receiver. The crystal can be warped onto frequency by the built-in trimmer capacitor.

Although the oscillators were tried only with the "Uni-Channel" receiver, it should work in the same manner with most other receivers. For example, the early Motorola high-band "G" receivers (TA140 and 140A) have an oscillator quite similar. Other receivers may require a slight bit of experimenting to get just the right level of signal, but that should not be difficult.

The construction of the STO series oscillators is excellent, as is the workmanship.

GREGORY ELECTRONICS EQUIPMENT CHECKED OUT ON OUR BENCHES

Motorola U51GGT 12 volt 40-50 MHz,
50 watt transistorized power supply,
narrow band,
complete with accessories..... $188.

MOTOROLA MOTRAC UNITS
(subject to availability)

Motorola Motrac, 30-50 MHz
U41HHT, 12 volt, 30 watt transistorized power and receiver supply.
Complete with accessories..... $288.
With "Private Line" less reeds if available, add..... $35.

Motorola Motrac U-51HHT, 30-50 MHz
12 volts, 60 watts, fully transistorized receiver and power supply, with
complete accessories..... $308.
with "Private Line", less reeds if available, add..... $35.

Motorola Motrac U71-HHT, 30-50 MHz
12 volts, 100 watts, fully transistorized receiver and power supply, with
complete accessories.....$388.
with "Private Line", less reeds if available, add..... $35.

Motorola 30-50 MHz, FMTR41V
front or rear mount, 6 volt, 10 watt,
complete with accessories
Narrow band transmitter..... $38.
Fully narrow band..... $48.
Rear or front mount, 12 volt
Narrow band transmitter..... $48.
Fully narrow band..... $58.

Motorola X41GGV special, consists of regular T41GGV, narrow band transmitter and wide band receiver, plus 150-170 MHz narrow band receiver in 15" case, including accessories..... $108

Motorola T31BAT 30-50 MHz Motorcycle Dispatcher, transistorized receiver and power supply, 6 volt, 12 watt, complete with accessories
including metal housing..... $78
T31AAT (same as above)..... $58.

Motorola T51G Series
vibrator power supply
TX narrow band.....$68.
RX wide band
Fully narrow band
(TX & RX).....$78.
Earlier serial
number.....$68.

Motorola

List $28.50/Dealer $19.95

High Band VHF
130-174 MHz
3 db gain

Special 5/8 wave. No-hole trunk lip mount. 125 watts. Model 707.
List $19.00/Dealer $13.30

High Band VHF
130-174 MHz
3 db gain

5/8 wave roof or deck mount. Covers entire VHF mobile frequency. Heavy duty construction. Field adjustable for lowest VSWR. 125 watts. 50 ohms. 55" height. Stainless steel whip.

SPECIFICATIONS:

- Gain ..... 3 db (Preliminary EIA)
- Frequency .... 130-174 MHz
- Power ..... 125 watts
- Impedance .... 50 ohms
- VSWR ..... Less than 1.5 to 1
- Lightning Protection .... DC ground
- Mounting ..... Patented stainless steel claw mount fits any size hole 3/8" to 3/4"
- Height ..... 55" maximum
- Coax ..... 22' RG-58U with PL-259 connector
- Weight ..... 1.3 lbs.
- Model 764

List $28.50/Dealer $19.95

UHF 450-470 MHz
5 db gain

Roof, deck or trunk mount with optimum spaced ½ wave elements. Coil loaded. Outperforms other UHF mobile gain antennas by at least 1 db. Only 38". Fully tuned at factory. Heavy duty stainless steel whip. 125 watts.

SPECIFICATIONS:

- Gain ..... 5 db (Preliminary EIA)
- Frequency .... 450-470 MHz
- Power ..... 125 watts
- Impedance .... 50 ohms
- VSWR ..... Less than 1.5 to 1
- Lightning Protection .... DC ground
- Mounting ..... Patented stainless steel claw mount fits any size hole 3/8" to 3/4"
- Height ..... 38"
- Coax ..... 22' RG-58U with PL-259 connector
- Weight ..... 1.4 lbs.

Model 765

List $28.50/Dealer $19.95

High Band VHF
150-174 MHz
3 db gain

Cowl mount disguise antenna. AM/FM.
110 watts. Model 712.
List $26.00
Dealer $18.20

High Band VHF
108-470 MHz
Unity gain

Super portable magnetic mount ¼ wave. 125 watts.
Model 759
List $16.00
Dealer $11.20

Low band 30-50 MHz heavy duty mobile antenna with **tapered** stainless steel whip, chrome plated, heavy duty spring and low profile ball mount.
Model No. 738.
List $22.00
Dealer $15.40

Complete antenna catalog upon request.
Base Station antennas drop shipped by manufacturer prepaid.
Mobile antennas shipped FOB, Saddle Brook, N. J.

AM Receiver strip
on 2.5 MHz..... $10.

National Electronic Laboratory Utilifone, model NEL 200, AM, 12 volt, 1½ watt, tuned on 121.9 MHz, with accessories, ideal for monitor receiver..... $18.

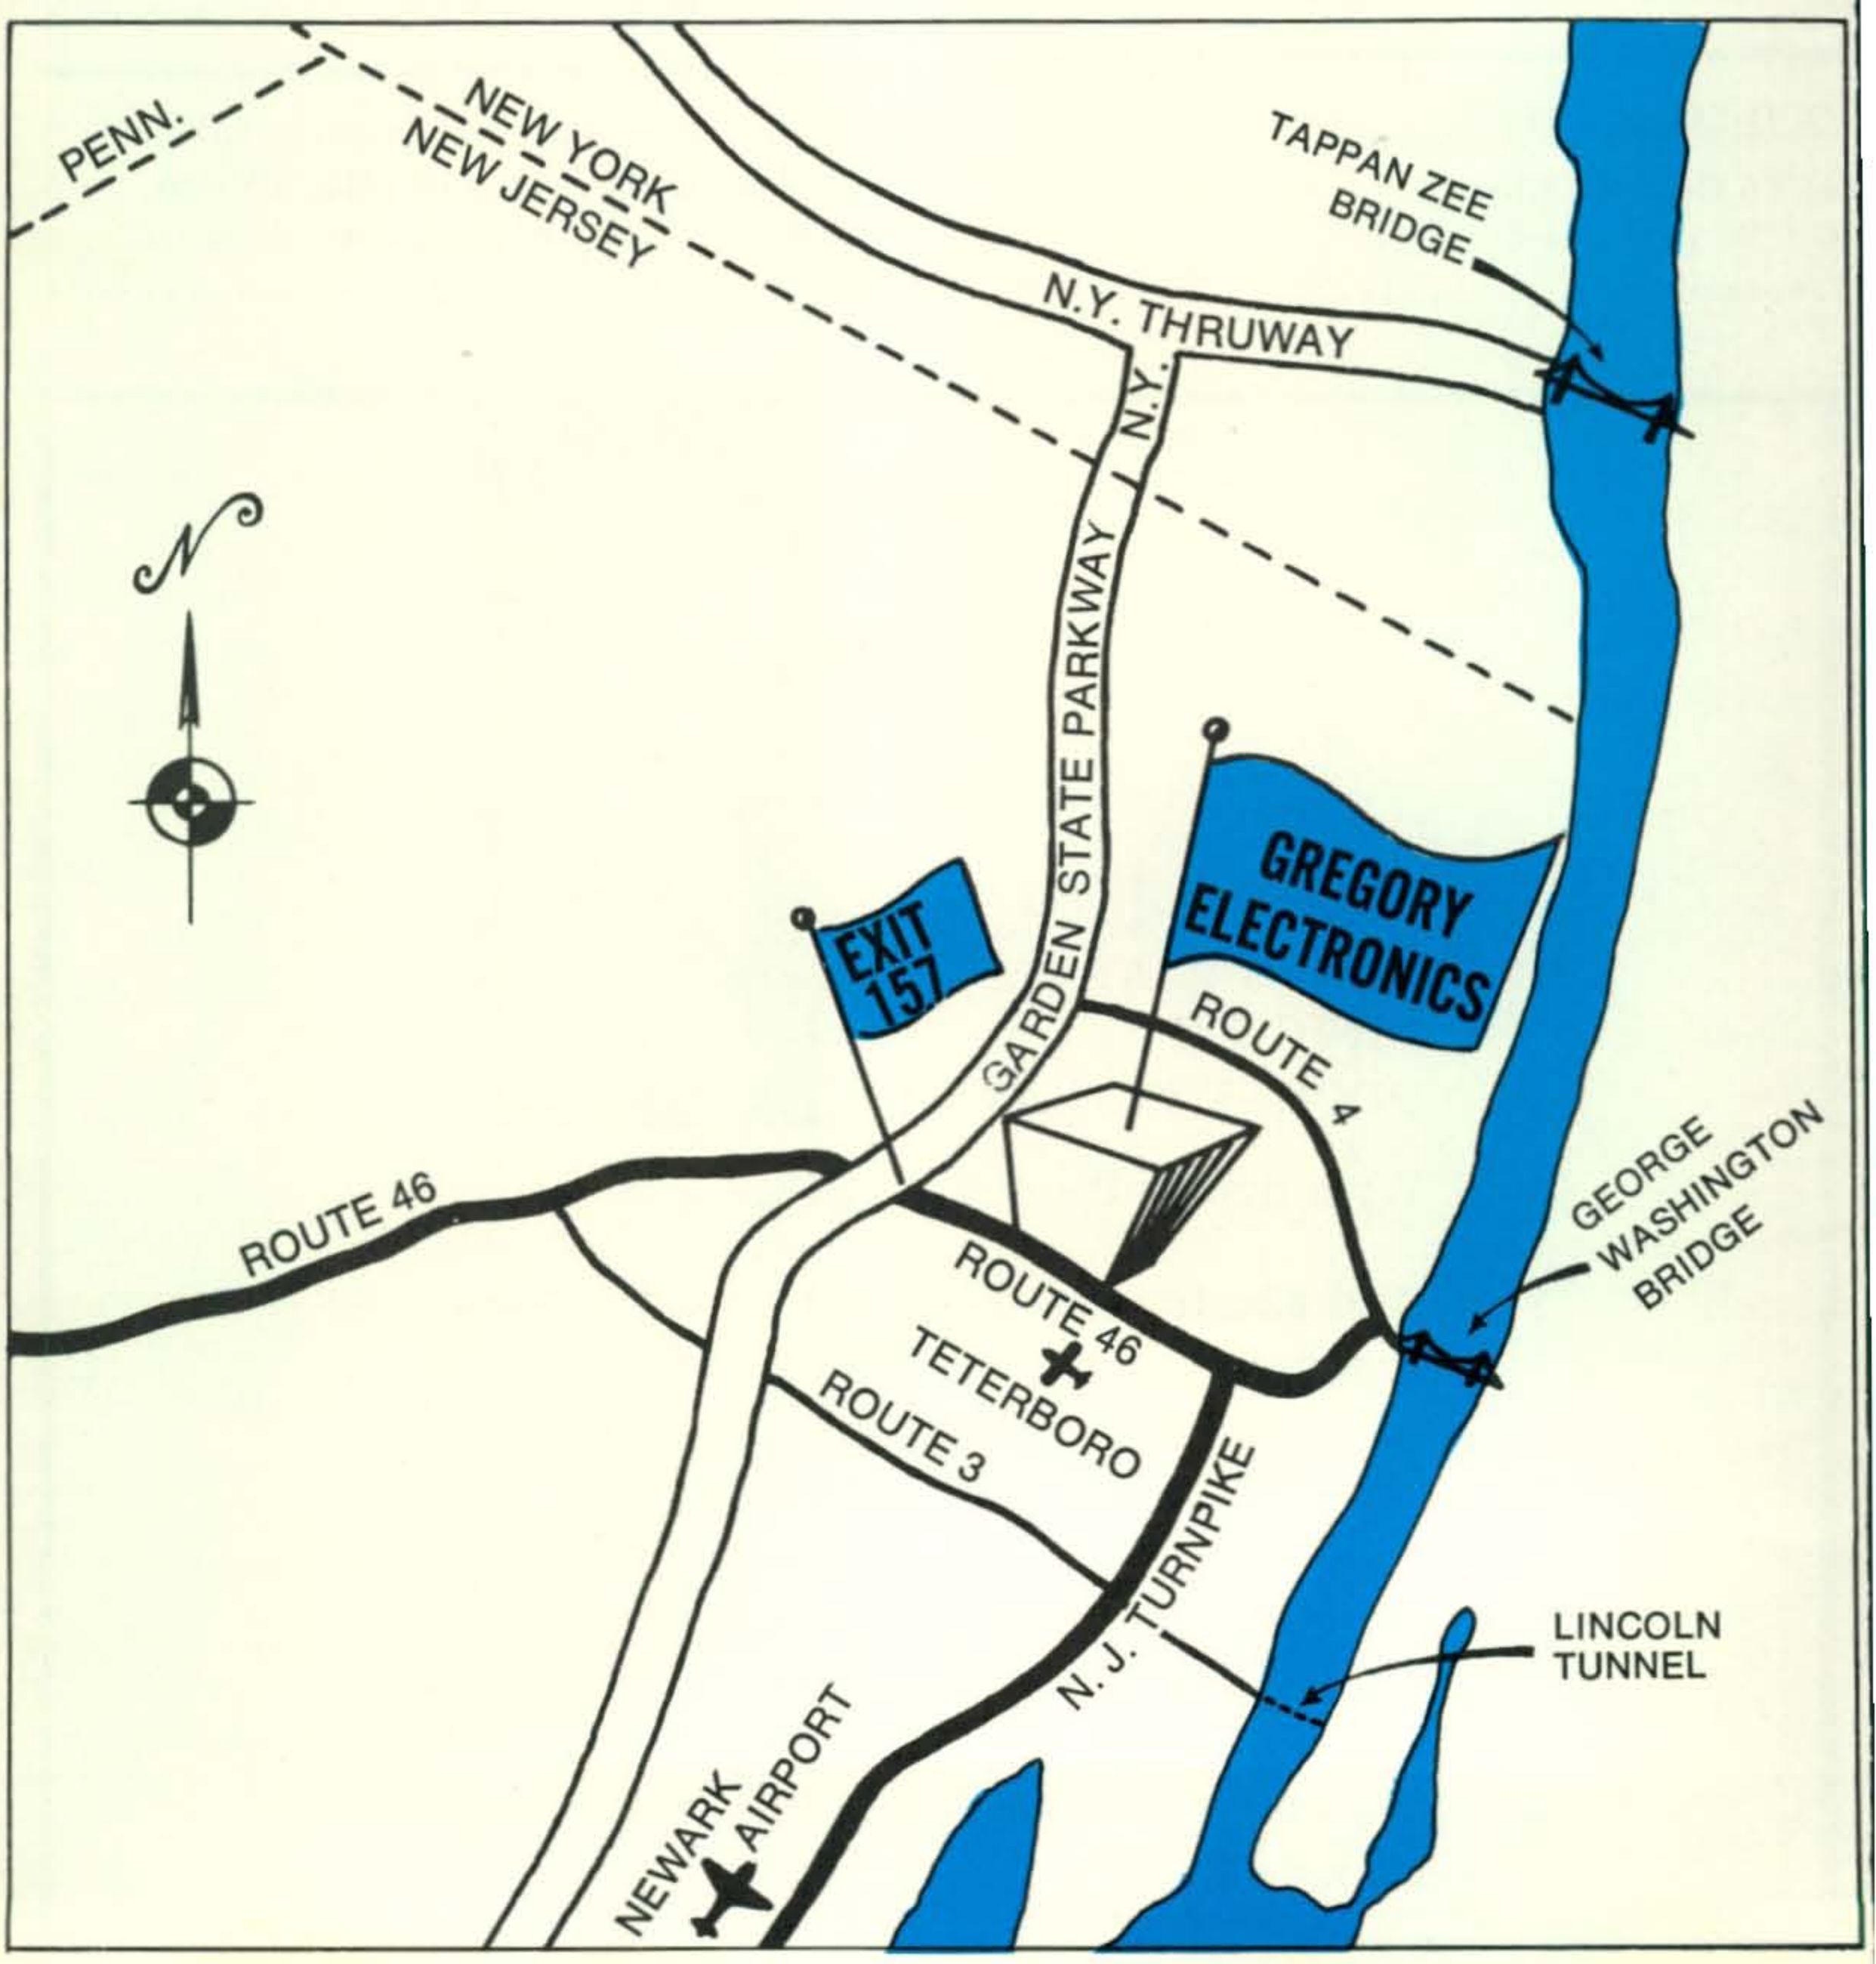
NINIC FM
POCKET RECEIVER

With dry battery..... $48.

Add $20 for crystals and tuning to your frequency. 30-50 MHz or 150-170 MHz
All units new. Solid state modular construction. Adjustable squelch. Sensitivity 0.3 microvolts to break squelch. Dual conversion crystal controlled. With conventional dry cell or chargeable ni-cad battery.
Weight: less than 1 lb. Size 6 5/8" x 2½ x 1¼".

We've Expanded...

We have expanded our warehouse to double its capacity. We can now stock a larger and more varied line of equipment. Should you be in our area (15 minutes from N. Y. C., see map below...), you are cordially invited in to browse. We now have the warehouse space to carry 15,000 pieces of used FM Mobile Communications Units.



DX

BY JOHN A. ATTAWAY,* K4IIF

WELCOME to 1972! The *CQ* staff sincerely hopes that this will be a great DX year for *you*. If your DX goals are among the highest, we hope that you will end the year challenging DL9OH, T12HP, W2TP, WA2RAU, and WA2IZS for top spot on the 2 × S.S.B. Honor Roll, W6ID and K6EC on the 2 × C.W. Honor Roll, and W4OPM on the WPX Honor Rolls. If DX is still your bag, but you're not that serious about it, we hope you'll complete WAZ and win several more WPX and *CQ* DX Award endorsement stickers. If you're a beginning DXer, send for our rules. You'll find that *CQ* has the most varied and balanced DX program of any organization in the world. Whether you like chasing zones, prefixes, or countries on either c.w. or s.s.b., we've got an award for you.

George's PROPAGATION column, elsewhere in this issue, indicates that the sunspot decline is continuing into 1972. By the end of the year, good 10 meter openings will be rare, and 15 meters will be quite spotty in comparison with what we've experienced for the past 5 years. Serious DXers will be spending more and more time on 40 and 80, and 20 will become the major workhorse band. Plans for new antenna systems should be made accordingly. More and more full size, multi-element 20 meter beams will be coming "out of mothballs" over the next couple of years, along with 20-40 meter duobanders and 40 meter monoband beams as the 10 and 15 meter arrays begin to find their way back into the attic to await better days. As the 1962 sunspot minimum proved, however, DX is always with us. When 10 and 15 go out and old reliable 20 weakens, 40, 80, and even 160 lenghten out to take up the slack. Go DX!

De Extra

There has been a great deal of comment in the DX bulletins lately regarding the operating skills of various rare DX stations. The following comments by Bev, W4CKB, are quite pertinent:

"Don Chesser, W4KVX, a savy DXer and former DX Editor of *CQ*, wrote over a decade ago that the DX operator—the man at the DX end of the line—is in absolute control of all pile-ups and operating procedures. On his skill alone rests the success of the operation, whether transceive or split frequency, and the possible variations to usual operating rules and procedures. In other words, the more skillful the DX operator, the more successfully he can break his own rules.

"From this, a corollary may be drawn: after the first towering pile-ups are created by a waiting DX world when the expedition first appears on the air, the manageability of the situation, including the need for rules, procedures, warnings, and threats, are inversely proportional to the DX operator's skill.

"Chesser's words are more true today than ever, as we increasingly encounter the use of lists, QSO's by call areas, and other such obstacles to total QSO productivity employed by the unskilled. Any set, unalterable operating tactic vehemently followed by a DX station contributes to poor usage of the best operating time.

*P.O. Box 205, Winter Haven, 33880

The CQ DX Award Honor Roll

The *CQ* DX Award Honor Roll recognizes those DXers who have submitted proof of confirmations with 275 or more countries for the mode indicated. The ARRL DXCC Country List, LESS DELETED COUNTRIES, is used as the country standard.

Few DXpeditions have created more excitement than the ET3ZU/A effort from Jabal At Tair in September, 1971. Left to right are John, K3BSY; Tony, I1IJ; Aldo, ET3ZU; Dick, F2QQ; Ron, F5QQ; and one of the lighthouse attendants.

"The highest echelon of skilled DX operators have consideration for all of us on the home end, combined with the psychic ability to convey to us, prior to QSO, the comfortable feeling of knowing exactly where we stand. There is one such top operator who used to travel the DX world and who can presently be found in South Carolina."

Bev refers of course to Mr. Gus Browning, W4BPD, first nominee to the CQ DX Hall of Fame. Browning is considered by many to be Mr. DXpedition.

Here and There

The Twin City DX Association of Minneapolis—St. Paul has re-elected Bill Higgins, WØYDB, as President; Dennis Luther, KØWWX, Secretary-Treasurer and added a Publicity Chairman, Don Tyrrell, WØMYX. President Bill is a member of the *CQ* DX Awards Advisory Committee, while club members Larry Shima, WØPAN, and Clyde Norton, WØELA, are Dakota Division Director and ARRL DX Advisory Committee Member, respectively, giving the club a strong voice in the high councils of amateur radio.

About the most productive DXer over the pole in 1971 was Venkat, VU2KV. In this photo he is operating from Port Blair in the Andaman Islands using the call VU9KV.

The ARRL DX Advisory Committee is considering the modification of criteria under which "countries" are defined for DXCC awards. It is rumored that this may lead to deletion of rocks and reefs, not definitely claimed by a real country, from the list. Presumably such "countries" as Geyser Reef, Minerva Reef, Maria Theresa Reef, *etc.* might be dropped, while claimed rocks and sandbars such as Baja Nuevo, Serrana Bank, Navassa, and Malpelo would be retained. However, this is purely speculation and it is suggested that you make your views known to your ARRL Director so that he can cast his vote according to the wishes of the DXers in his Division. At a recent meeting the Florida DX Club voted 19-2 in favor of deleting the unclaimed real estate. This column has long been in favor of removing any island from the list which under normal circumstances, was unsuitable for permanent human habitation.

The Northern California DX Club has unanimously passed two motions which honor the memory of the late David P. Baker, W6WX, an outstanding club member and CQ DX Committeeman. The first seeks to establish W6WX as the official call of the newly organized NCDXC Repeater Association, while the second involves club sponsorship of a David P. Baker Memorial Award to be given each year to the highest scoring single operator station in the c.w. contest.

The International DX Association announces that as of July 1, 1971, 1750 DXers had joined their group. This included 400 plus DX stations representing 85 countries. Club officers are

Rare and Special Prefixes

1971 may well go down in history as the best year on record for new prefixes. Burgeoning activity by U.S. amateur organizations interested in commemorating major local events with special stations was an important factor, as was similar interest in other countries. In addition, the expanding amateur populations of such countries as Germany and Japan led to the activation of entire new prefix groups such as the JD, JE, JH, DB, and DF series, while the new Italian island prefixes provided a bonanza from the Mediterranean.

A quick comparison of the WPX Honor Roll in the January, 1971 issue with that in the December, 1971 issue shows that the top score in the s.s.b. category increased by 126 prefixes, while the top mixed score was up a full 100 prefixes, phone up 81 prefixes, and c.w. up 50 prefixes. All categories of the WPX Honor Roll increased in membership despite the fact that the minimum number of prefixes to qualify for Honor Roll standing was raised from 550 to 600 in each case.

The official list of special calls issued by the FCC for the late summer and early fall months is listed below.

The FCC asks that amateurs and organizations apply for special calls at least 120 days prior to the desired date of authorization for the calls.

Other rare prefixes reported in late 1971 include the following:

If you want to hear a pileup, tune in when this fellow comes on the air. He's Yonten, AC5TY, Director of Wireless Communications for the Kingdom of Bhutan. Yonten is active near 14030 kHz at random intervals during the 1300-1500 GMT time slot. He uses a 400 watt transmitter and a dipole antenna oriented east-west. QSL direct to T. Yonten, AC5TY, Director of Wireless Communications, Dechentsi, Thimpu, Bhutan. *(Photo courtesy K9KDI and Northern Illinois DX Association)*

EIØ—EIØDI operated from Dolkey Island off the Irish coast.

FMØ—FMØIX was by W7VRO and associates during September, 1971.

IH9—IH9LAW has been active from the rare Pantelleria Island.

KFØ—KFØMEX on 14 MHz during August, 1971 was at the Iowa State Fair.

Amateur Radio in the U.S.S.R.

Since the beginning of the series on amateur radio in other countries we have been anxious to present information on the status of our hobby in the Soviet Union. However, 2 years of attempts through official channels were fruitless. The Soviet Embassy in Washington was sympathetic, but nothing materialized. The Central Radio Club in Moscow was uninterested. However, a gentleman very familiar with the situation there has provided us with the following information which should be of considerable interest to you.

"In Russia their regulations strictly forbid conversational type QSO's. Amateurs may not answer questions except those pertaining to equipment, DX, and other subjects directly related to the hobby. For example, they may not answer questions such as 'Did you receive the letter I sent?'

"Since ham radio is largely self-policed, each club has a monitoring committee which *regularly* questions members at meetings and makes tape recordings of QSO's. Violators are routinely suspended. Leaders and prominent DXers get away with certain things, but fear that they may be subject to censure at any time.

"In the U.S.S.R. amateur radio is called 'radio sport'. As such it belongs to a sports federation, and internal contests, transmitter hunts and related events are the important things. International DXing is of secondary importance. High officials are not interested in DX, and it is virtually impossible to get the regulations changed.

"If you win enough contests to tally up a

Propagation

BY GEORGE JACOBS,* W3ASK

THE Swiss Federal Observatory reports a monthly mean sunspot number of 48 for September, 1971. This results in a smoothed sunspot number of 72, centered on March, 1971. The sunspot cycle continues to decline at a fairly rapid pace. For an in-depth analysis of the present solar cycle and a solar and shortwave propagation prediction for the New Year see, "Sunspot Cycle 20—Progress 1971: Prediction 1972," appearing elsewhere in this issue of *CQ*.

Typical winter shortwave propagation conditions are expected to continue through January. Maximum usable frequencies should remain high during the daylight hours, dropping to seasonally low values during the hours of darkness. Static levels are expected to be at their lowest values of the year in the northern hemisphere, and signal levels are predicted to be exceptionally strong during many band openings.

The following is an overall picture of shortwave band conditions for January, 1972. For specific times of DX openings refer to the *DX Propagation Charts* which appeared in last month's column. This month's column contains *Short-Skip Propagation Charts* for January and February, as well as Charts centered on Alaska and Hawaii. The *Short-Skip Charts* contain propagation forecasts for paths varying in distances of between 50 and 2300 miles.

This propagation forecast is based upon a predicted smoothed sunspot number of 51, centered on January, 1972.

10 Meters: Some fairly good DX openings during the daylight hours, mainly to southern and tropical regions, but some also possible to Europe and the Far East. Some short-skip openings, between distances of approximately 1300 and 2300 miles, are also forecast for the afternoon hours.

15 Meters: Generally good 15 meter DX openings to many areas of the world are forecast for the daylight hours. Some openings to southern and tropical areas may occur during the late afternoon and early evening hours as well. Fairly consistent short-skip openings, resulting from regular F-layer reflection, are expected during the daylight hours over distances ranging between 1000 and 2300 miles.

*11307 Clara Street, Silver Spring, Md. 20902

LAST MINUTE FORECAST

Day-to-Day Conditions and Quality for January, 1972

Days	*Rating & Forecast Quality* (4)	(3)	(2)	(1)
Above Normal: 2, 7, 9, 15, 22-23, 29	A	A	B	C
Normal: 1, 3, 5-6, 8, 10, 12, 14, 16-17, 21, 24, 27-28, 30	A	B	C	D
Below Normal: 4, 11, 13, 18, 20, 25-26, 31	C	D	D	E
Disturbed: 19	D	D	E	E

How To Use These Charts

The following is an explanation of the symbols shown above, and instructions for the use of the *CQ* propagation predictions:

1—Enter Propagation Charts on following pages under appropriate band and distance or geographical area columns. Read predicted times of band openings at intersection of both columns.

2—Following each predicted time of band opening is a forecast rating which indicates the relative number of days the band is expected to open during each month of the forecast period. The higher the rating, the more frequent the opening, as follows: (4) band open more than 22 days each month; (3) between 14 and 22 days; (2) between 2 and 13 days; (1) less than 7 days.

On the "Short-Skip" Chart where two numerals are shown within a single set of parenthesis, the first applies to the shorter distance for which the forecast is made, and the second to the greater distance. Note the forecast rating for later use.

3—With the forecast rating noted above, start with the numbers in parenthesis at the top of the "Last Minute Forecast" appearing above. Read down the table for a day-to-day forecast of propagation conditions in terms of Above Normal (WWV rating high than 6); Normal (WWV rating 5-6); Below Normal (WWV rating 4); Disturbed (WWV rating less than 4). The letter symbols (A-E) describe reception conditions (signal quality, noise and fading levels) expected for each day of the month and have the following meaning: (A—excellent opening with strong, steady signals; B—good opening, moderately strong signals, little fading and noise; C—fair opening, signals fluctuating between moderately strong and weak; D—poor opening, signals generally weak and considerable fading and noise; E—poor opening, or none at all.

4—This month's short skip Charts are based upon a transmitter power of 75 watts c.w.; 150 watts s.s.b., or 800 watts d.s.b., into a dipole antenna one quarter-wave above ground on 160, 80 and 40 meters and a half-wave above ground on 20, 15 and 10 meters. For each 10 db increase above these reference levels, reception quality shown in the "Last Minute Forecast" will improve by one level; for each 10 db loss reception will become poorer by one level.

5—Local standard Time for these predictions is based on the 24-hour system.

6—The short skip Charts are valid through Feb. 1972. These Charts are prepared from basic propagation, data published monthly by the Institute for Telecommunication Sciences of the U.S. Dept. of Commerce, Boulder, Colorado.

20 Meters: Good DX conditions to most areas of the world are forecast for 20 meters between sunrise and the late afternoon hours. Signals may be exceptionally strong shortly after sunrise and during the afternoon hours, when conditions should peak on this band. Good short-skip openings, over distances between 750 and 2300 miles, should also be possible during the daylight hours. Openings over shorter distances, with the skip often as short as a few hundred miles, are expected during the early afternoon hours. On a few nights during the month, when propagation conditions are above normal, the band may re

main open for both DX and short-skip propagation well into the hours of darkness.

40 Meters: The band is expected to open for DX during the late afternoon hours, with conditions peaking during the hours of darkness and at sunrise. Static levels should remain at low seasonal values throughout the month, and signals often should be exceptionally strong. During the daylight hours, good short-skip openings should be possible over distances ranging between 150 and 750 miles. During the hours of darkness, the short-skip range is expected to increase to between approximately 1000 and 2300 miles.

80 Meters: Solar absorption and static levels are expected to remain at low seasonal values during January, which should permit some fairly good DX openings to many areas of the world during the hours of darkness and the sunrise period. During the hours of daylight, short-skip openings are forecast between distances of approximately 50 and 350 miles. During the hours of darkness, short-skip openings should be possible between distances of about 250 and 2300 miles.

160 Meters: On evenings when static levels are low, some DX openings should be possible on this band from a few hours after sunset to shortly before sunrise. Short-skip openings up to 2300 miles are forecast during the hours of darkness. Because of normally high solar absorption, ionospheric propagation is not normally possible during the daylight hours on 160 meters.

V.H.F. Ionospheric Openings

January will be a relatively poor month for v.h.f. ionospheric propagation. The solar cycle has declined to a point where F-2 layer 6 meter openings are no longer possible, and relatively little sporadic-E or auroral activity is expected during the month.

It is also a poor month for trans-equatorial scatter (TE) propagation, but an occasional opening may occur on 6 meters between the southern third of the USA and South America between 8 and 11 P.M., local time.

On the optimistic side, some fairly good meteor-scatter openings should be possible on the v.h.f. bands during January 3-4, when the *Quadrantids* meteor shower is expected to peak with about 30 to 40 meteors entering the earth's atmosphere each hour. While of relatively short duration, the *Quadrantids* is usually an intense shower.

Some v.h.f. openings may also be possible during periods of ionospheric storminess on the h.f. bands. Check the "Last Minute Forecast" appearing at the beginning of this column for those days that are expected to be "below normal" or "disturbed", since these are the days on which v.h.f. ionospheric openings are most likely to occur.

HAPPY NEW YEAR TO ALL! This column starts my eighth year with *CQ*, and it has been made possible by the complete cooperation and help from *all of you*, thanks!

The January, "Story of The Month" is:

Lee R. Brooks, K8BHG
All Counties #24, 3-25-70

Lee was first licensed in 1955 and became interested in the County Hunting Program shortly after it started, but waited until August 1962 before applying for the basic 500 Award.

He soon worked up to 1000 on c.w. and a.m. but did not apply for it and shortly lost interest as the counties seemed almost impossible to get.

In 1965 an s.s.b. transceiver was obtained and he soon ran across the County Hunters Net and his interest was revived and he made up his mind to work hard at it and get them all.

Lee insists it has been a most rewarding experience. In addition to meeting so many nice people without whose help All Counties would have been impossible, he sure had fun refreshing his memory about the good old U.S.A. and its geography. Like most who have participated in County Hunting, Lee says a nicer bunch of fellows and gals would be impossible to find, and now he hopes to make them All on 14 MHz s.s.b.

Lee was born December 15, 1917 and has spent most of his life in Bluefield, W. Va., except for 5 years in the Air Force during WWII.

He first became interested in amateur radio at age 15 through a ham neighbor, but did not

*P.O. Box 73, Rochelle Park, N.J. 07662.

Independent County Hunters Convention Kansas City—July 4, 1971.

Minnesota Twin's Certificate.

get his license until leaving the Air Force.

Although he has over 100 awards, the USA-CA is the one most prized, and he is pleased to see how the USA-CA Program has really caught on and grown from the comparative few to the large group now chasing the counties.

Lee has been employed by the local post office for 21 years. Amateur radio is his main hobby and although happily married, has no children.

He has had the pleasure of meeting some of the County Hunters as they passed through W. Va., like Eddie, K4LSP; Otts, K8CIR and Al, K5HKG.

The present equipment includes a Galaxy V Mk II and a TA-33 beam. Lee promises to continue his mobiling and is happy to give out needed counties in his area.

I've tried for many months to get a foto from him, but had no success.

Awards Issued

As per the Special Honor Roll, two more qualified for All Counties.

Andy Abraham, W3JZY was issued USA-CA 500 Award endorsed All 14; All 7; All 3.9; and All S.S.B. 1000 and 1500 endorsed All S.S.B. 2000 endorsed All S.S.B. and the rest through All Counties, endorsed Mixed. Andy waited until he had them all before sending his application.

Ella Koons, WØAYL qualified for USA-CA 500 Award endorsed All 3.9; All 14 MHz; All S.S.B. 1000 and 1500 endorsed All 14 MHz S.S.B. 2000, 2500 and 3000 endorsed All Phone and All Counties endorsed Mixed. Ella also waited for them all before sending her application.

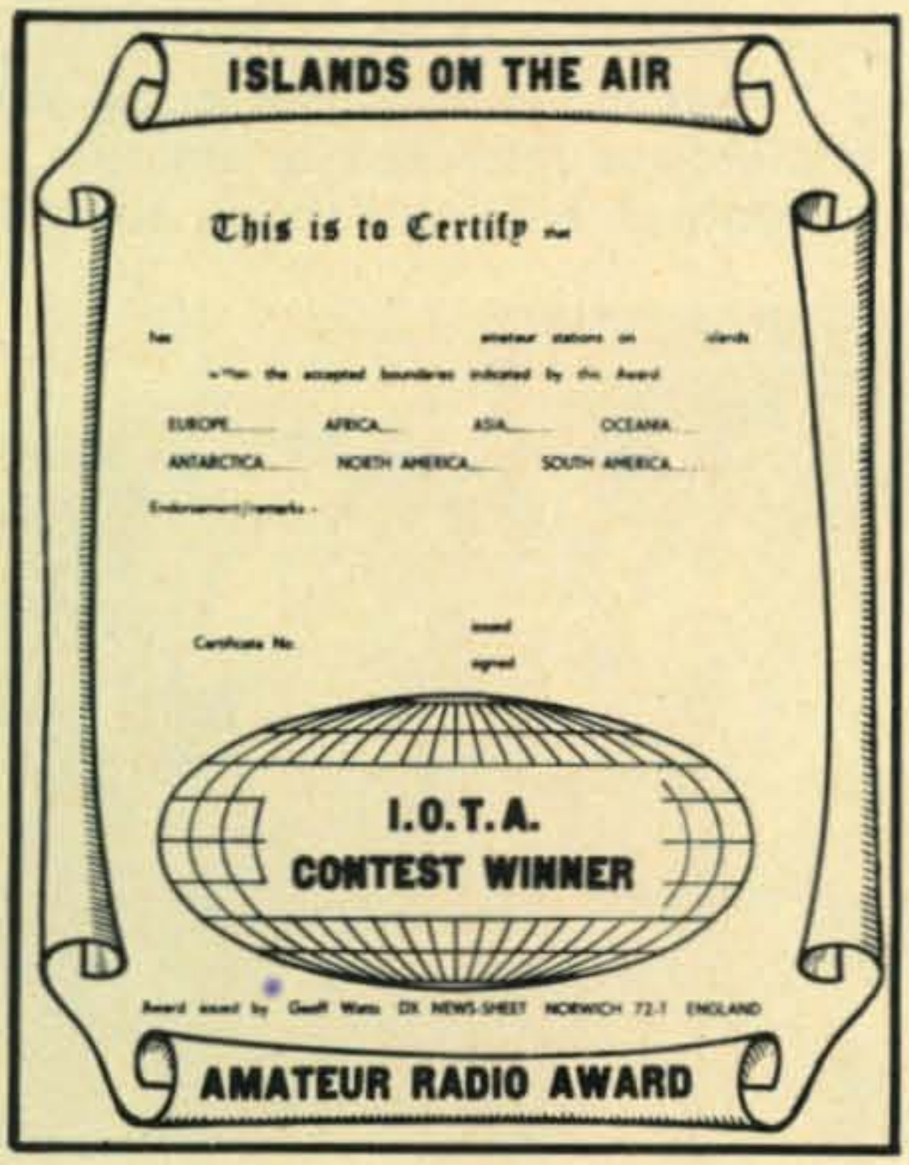
Mike Baustian, WAØKQQ was issued USA-CA-3000 endorsed Mixed and USA-CA-500 through USA-CA-2500 endorsed All 14 MHz S.S.B.

John Robertson, W5OB (exW5BUK) acquired USA-CA-2000.

Doug Bowles, VE4QZ was issued USA-CA-1000.

USA-CA-500 Awards endorsed Mixed went to: Hakan Ekdahl, SM5BHW; Howard Batie, W7BBX/4; and Jeff Johnson, G2BJY.

Yes, his application finally arrived and Al Shawsmith, VK4SS qualified for USA-CA-500 Award endorsed All A-1; first award to a VK4.



Islands On The Air.

Awards

The Islands-On-The-Air Award (IOTA): Issued by Geoff Watts, *DX News-Sheet,* of England. IOTA Awards are available to licensed amateurs (and short-wave listeners) for confirmation of QSOs with amateur stations located on islands throughout the world.

IOTA Africa Award	IOTA-AF
IOTA Antarctica Award	IOTA-AN
IOTA Asia Award	IOTA-AS
IOTA Europe Award	IOTA-EU
IOTA North America Award	IOTA-NA
IOTA Oceania Award	IOTA-OC
IOTA South America Award	IOTA-SA
IOTA Arctic Islands Award	IOTA-AI
IOTA British Isles Award	IOTA-BI
IOTA West Indies Award	IOTA-WI
IOTA World Diploma	IOTA-WW
IOTA Century Club Award	IOTA-CC-100
	IOTA-CC-200, *etc.*

IOTA Silver Cup for gaining all 12 IOTA Awards

IOTA Yearly Contest & Silver Cup. The top-scoring station and top-scoring short wave listener in each continent receives a special award, (also the U.K. Champion & s.w.l.). The World Champion station & s.w.l. will have their Award endorsed accordingly, and will receive the IOTA Cup. The IOTA Contest runs from 0000 GMT January 1st to 2400 GMT December 31st each year.

The 18-page *Directory-Of-Islands* lists all the islands and island groups which count for IOTA, and also contains information on all the Awards mentioned and full details of the IOTA Contest. Cost of IOTA Directory is 4 IRCs, or air-mail 6 IRCs. Geoff Watts, *DX News-Sheet,* 62 Belmore Road, Norwich, NOR 72T, England.

Geoff issues a weekly News-Sheet read by most of the top DX-men in Europe and U.S.A. and also about 70 other countries. The *DX News-Sheet* is mailed on Tuesday around 2400 GMT and current commemorative postage-stamps are used, when available. Due to change in price of IRCs and value of U.S. Dollars, I might make error on air mail cost to Asia, Africa, and America but I am rather sure the present cost for 55 issues is $9.50 and can be paid by postal order, Check, Banknote or IRCs ($1.00 = 8 IRCs).

Minnesota Twin's Certificate: Issued free for having QSOs with WØQXA and her twin sister, WØQXF. One twin must be worked on phone and the other on c.w. and it does not matter which is which.

Notes

Yes, the fine photograph of the group at the Independent County Hunters Convention in Kansas City July 4th came. Unfortunately a couple were not identified and perhaps there could be some identification errors, but I think they are few, and I'll be happy to make any additions/corrections in a future issue of *CQ*. Although the identifications are listed in 5 rows, the rows are not very straight and to help you follow them across, I will identify each member of the opposite sex with (F) for female after their call. Members of MARAC received a special sheet with their photograph to help with their identification, unfortunately I can not reproduce it. Back row: WB6AUA; WN6BGM(F); K9GTQ; WA9LNW; W3RWJ; W4KA; K4ZLE; W9DRL; K9DCJ; WA9SKB; W2EQQ; WAØJRZ; W3FVU; KØQIX; WB8DRR; WA4ULL; K6HZI; KØTVY; WAØLPA.
Row 2: KØARS; K8DCR; K7ZJP; K4KA; SM5EAC; K9KYF; K9LUI(F); W9SOM; W9CNG; WØGV; W4IGW; W4HA; WBØCQE; WA5SKI(F); W9ZHD; VE6AYU; WAØCSL(F); WAØVDO(F); KØPFV; W2BLM; K9CSL; WB4GGA; ??; W1AQE; K3LXN; VE3GCO; s.w.l.; K8RNH; W5HDK; KØIFL; ??.

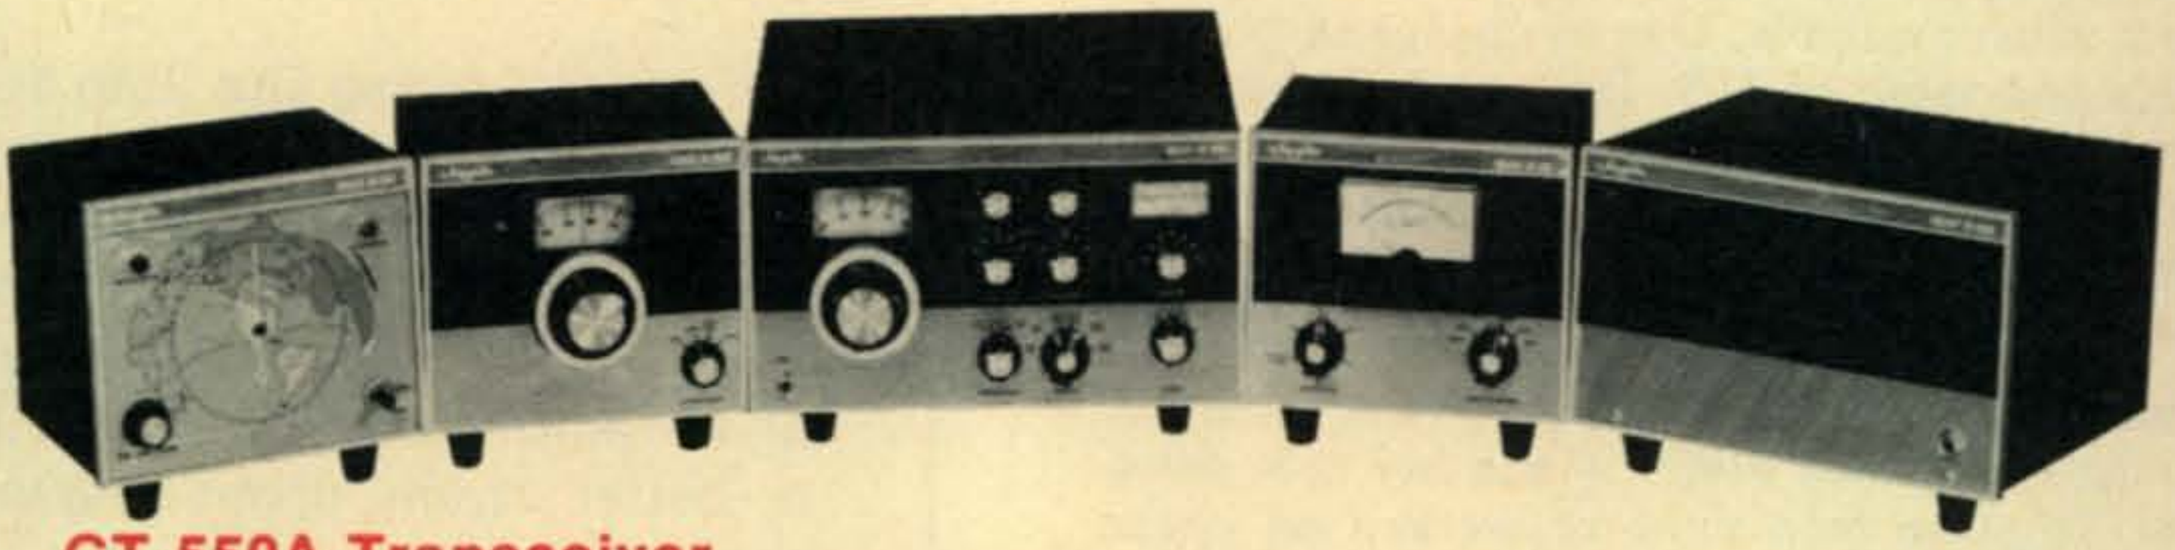
The most powerful signals under the sun!

When You Really Know.

hy·gain/galaxy



GT-550A Transceiver

- Unmatched dependability, flexibility and low cost
- Top performance either fixed station or mobile
- Higher power output than other popular transceivers available today
- Standard of the industry in frequency stability
- Outstanding receiver stability and selectivity
- Full line of accessories for integrated station capability

Order No. 855 Ham Net $495.00

RV-550A Remote VFO

- Solid-state construction
- Complete with plug-in cables
- Function switch controls Receive-Transceive-Transmit frequency independently

Order No. 856 Ham Net $95.00

RF-550A R.F. Console

- Contains precision wattmeter with top accuracy in range of 3.5/30.0 MHz
- Switch select forward or reflected power—calibrated scales are 400 and 4,000 watts full scale
- Switch select 5 antennas plus a dummy load

Order No. 857 Ham Net $75.00

RB-550A Rotator Control

- All new control head for Hy-Gain model 400 Rotor Brake Rotator
- Contains solid-state logic circuit to furnish electrical information for rotation and control of tower mounted rotator

Order No. 859 Ham Net $59.95

SC-550A Speaker Console

- Matching speaker with headphone jack for the transceiver, complete with cable
- AC-400 power supply mounts inside console

Order No. 858 Ham Net $29.95

.Quality Equipment.....
GT-550A System

Phone Patch PR-550
Order No. 812 Ham Net $49.00

Crystal Controlled Adaptor XO-550
Order No. 811 Ham Net $49.00

AC Supply AC-400
Order No. 801 Ham Net $99.95

Mobile Supply G-1000DC
Order No. 802 Ham Net $129.95

CW Filter F-3
Order No. 808 Ham Net $37.50

Calibrator CAL-250
Order No. 806 Ham Net $25.00

VOX Accessory VOX-35C
Order No. 807 Ham Net $29.95

Mobile Dashboard Mounting Bracket—GTM
Order No. 809 Ham Net $8.95

Floorboard Adaptor—ZZM (Not Shown)
Order No. 810 Ham Net $6.00

Q AND A

BY WILFRED M. SCHERER,* W2AEF

HFO and BFO Drift

QUESTION: Can you suggest how to cure a b.f.o. frequency shift in my NC-155? The shift occurs when my central air-conditioning system goes on and drops the a.c. voltage to the receiver by about 3 volts. The frequency shift is downward. The receiver returns to the original frequency when the air conditioner shuts off. The regulated voltage to the b.f.o. seems stable; however, the 6.3 v.a.c. to the filaments and the unregulated d.c. voltages suffer a drop when the air conditioner kicks in.

ANSWER: First we suggest that the problem might lie with the h.f. local oscillator and not with the b.f.o.; nevertheless, whichever the case may be and since the plate voltage for the oscillators is regulated, the probable cause of frequency shift with line-voltage variations is change in heater voltage at the tube. This may also be regulated using the scheme described in *CQ*, November 1968, under the title "Simple Heater-Voltage Regulation." A practical application also will be found in *CQ*, December 1968, under the title "More On Updated Improvements For The 51J Receiver."

Fuse Ratings

QUESTION: If one takes a 250-volt 2-ampere fuse, can it be used at 125 volts at 4 amperes? In other words, are the voltage and current ratings of fuses indirectly proportional?

ANSWER: The answer is no. The voltage rating relates to voltage breakdown or the arc created when the fuse blows. A 2-ampere 250-volt fuse will still carry only 2 amperes on a 120-volt circuit. The carrying capacity depends only on the current which when excessive, generates sufficient heat to melt the fusing element.

Apache TX-1 on 1815 kc

QUESTION: I should like to add coils to the Heath Apache TX-1 to cover the 160-meter band for spot frequency only, such as 1815 kHz. Do not desire full coverage on v.f.o.—can use crystal. Have you published any such data?

ANSWER: We have not published any data on modifying the Apache TX-1 for operation on 1815 kHz. What would be required is quadrupling the total inductance at L_{11}-L_{12} and at L_{17}-L_{18}. You can also use the alternative of doubling the above inductance values while also doubling the capacitance values at C_{37} and C_{52}. Increasing the capacitance at C_{53} also may be needed to sufficiently unload the p.a., depending on the impedance of the transmission line.

Since for 80-meter operation, the v.f.o. functions on the 160-meter band, either v.f.o. or crystal-controlled operation may be used for 160 by engaging the 80-meter position for this and the above suggested changes.

Hy Gain Model 400 Rotator Installation

Chek Titcomb, W1SD, has forwarded the following comments which should be worth noting:

"The review of the Hy Gain Model 400 Antenna Rotator in the August 1971 issue of *CQ* was read with interest. It is complete in all respects from my experience with the Model 400, except for one important point which makes it unsuitable for some installations.

The review touched upon the problem associated with the Model 400 as it pertains to the off-set of the antenna drive shaft. But it needs to be emphasized that popular heavy-duty towers, such as the Tri-Ex Model LM-470, cannot be completely retracted with the Model 400 mounted on the top section, although the top section of this tower has the leg spacing of approximately 14". The off-set mentioned in the review is the cause.

This will not become an important factor, unless the user has purchased the Tri-Ex TA-70L tilt-over accessory to facilitate antenna installation, adjustment and experimentation. It becomes impractical to attempt to tilt the tower when not fully retracted with a sizeable array mounted above the top. After all, why go to the expense of a heavy-duty rotator such

[*Continued on page 88*]

Hungarian Contest

Starts: 0000 GMT Sunday, December 26
Ends: 2400 GMT Sunday, December 26

This is a world wide type contest with operation permitted on all bands, both phone and c.w. There are three categories, single operator, multi-operator and s.w.l.

Exchange: RS/RST and your ITU Zone number.

Scoring: Contacts between stations on the same continent 1 point, on different continents 3 points. If it's with an HA/HG5 it's worth 4 points and 5 points if it's an HA5.

The multiplier is determined by the number of different ITU Zones worked.

Final Score: Total QSO points multiplied by the sum of ITU Zones worked.

Awards: The world leaders in each of the three categories will receive the Budapest Memorial Plaque. And certificates to the top stations in each country in each category.

A summary sheet with the scoring and all the necessary data, and a signed declaration is also requested.

Mailing deadline is January 15th to: BRAL Contest Committee, P.O. Box 2, Budapest 134, Hungary.

HARC "Operation's Day"

Starts: 1700 GMT Saturday, January 8
Ends: 2300 GMT Sunday, January 9

The Hollywood ARC announces its first "Operations Day." The Club will have its station WB4TON active during the full 30 hour period.

Exchange: Signal report, state, province or country and operators name.

Awards: Special QSL card to everyone working WB4TON, a certificate if you work him on both c.w. and s.s.b., and a special certificate if its on all 5 bands.

On c.w. look for them 70 kHz in from the bottom end of each band. On phone 3930, 7230, 14330, 21430, 28530.

Send your QSL and list of contacts you had with WB4TON, along with a s.a.s.e. to: Robert Patten, W4OZF, 2311 West Nassau Drive, Miramar, Florida 33023.

Louisiana QSO Party

Starts: 1800 GMT Saturday, January 15
Ends: 2200 GMT Sunday, January 16

This is the 7th annual party sponsored by the

Ellen White, W1YL, Deputy Communications Mgr. of ARRL, presenting Rick Niswander, WA8VRB the North America continental Plaque. Rick was the operator at HR2GK in the 1971 ARRL DX C.W. Contest.

*14 Sherwood Road, Stamford, Conn. 06905.

John Lawrence, K1KTH holding the Potomac Valley Radio Club Phone Trophy, highest United States all band award in the 1969 CQ WW Contest. John did it again in 1970 on C.W. this time. I'm minding the Frankford Radio Club Trophy for him.

Lafayette ARC. The same station may be worked on each band and mode for QSO points. Louisiana may work other La. for QSO points.

Exchange: QSO nr., RS (T) and QTH. Parish for La., ARRL sections for others.

Scoring: Each QSO counts 1 point. La. multiply total by number of ARRL sections worked, (max. of 75) Others use La. parishes for their multiplier. (max. of 64).

Frequencies: 3600, 7075, 14075, 21075, 28100. on c.w. and 3915, 7260, 14300, 21400, 28700 on phone.

Awards: Certificates to winners in each ARRL section, VE8 and each country. There are 1st, 2nd and 3rd place awards in Louisiana. The W5-PM Trophy goes to the top winner in La. and the W5DDL Trophy to the highest scoring portable station. There are additional awards for portables operating from rare parishes.

A minimum score of 50 points for U.S. and 25 points for DX is required for an award.

Mailing deadline is Feb. 5th to: Lafayette ARC, c/o Danny Griffith, K5ARH, 123 Normandy Road, Lafayette, Louisiana 70501. Include a large s.a.s.e. for copy of results.

Herb Schoenbohm, KV4FZ came all the way from St. Croix, V.I. to attend the "Round-up." and pick-up the two Trophies he won in the 1970 CQ WW Contest. I'm holding the Bill Leonard, W2SKE Trophy, world champion on all band phone. Herb is diplaying the Earl Lucas, W2JT Memorial Trophy, donated by the North Jersey DX Assoc. for the highest c.w. score on a single band, (14 MHz) in the world.

Arkansas QSO Party

Starts: 2200 GMT Saturday, January 22
Ends: 0400 GMT Monday, January 24

This is the 7th annual party for the North Arkansas ARS. The same station may be worked on each band and mode for QSO points.

Exchange: QSO nr., RS(T) and QTH. County for Ark., state, province or country for others.

Scoring: Ark. stations score 1 point per QSO and multiply total by the number of states, VE provinces and DX countries worked. Outside stations score 5 points for each Ark. station worked and multiply total by Ark. counties. (max. 75)

Frequencies: C.W.—3560, 7060, 14060, 21060, 28060. Phone—3960, 7260, 14300, 21360, 28560. Novice—3735, 7175, 21110.

Awards: Certificates to the top scoring station in each state, VE province and DX country with 100 points or more.

Mailing deadline Feb. 21st to: North Arkansas ARS, c/o Don Banta, WA5ZKE, Route 1, Green Forest, Arkansas 72638.

CQ WW DX 160 Contest

Starts: 2200 GMT Friday, January 28
Ends: 1500 GMT Sunday, January 30

Starting time has been made two hours earlier to take advantage of possible European openings, otherwise rules remain same as last year, except for modified QSO exchange. This is a c.w. **only** contest. No c.w. to phone or cross band contacts allowed.

Exchange: QSO nr., RST and your state or province. It is not necessary for DX to send their QTH, the prefix will identify them.

Scoring: For W/VE/VO, 2 points per QSO with other W/VE/VO stations. Contacts with all DX, 10 points for each QSO.

For all other countries: 2 points per QSO with stations in the same country, 5 points with stations in other countries. Except contacts with W/VE/VO which count 10 points.

Multiplier: For all stations, a multiplier of one (1) for each US state, Canadian province and DX country worked.

Final score: The total QSO points multiplied by the sum of the multiplier.

Disqualification: Violation of the rules and regulations pertaining to amateur radio in the country of the contestant, or the rules of this contest, or unsportsmanship conduct, or taking credit for duplicate contacts in excess of 3 per-

First-Class Listening Post!

Everything you need for only 119.95. At over 1200 Radio Shack and Allied Radio Stores.

Walter Skudlarek, DJ6QT the 1970 European Phone Champion, being presented the W4BVV Operators' Trophy by our own John Attaway, K4IIF, during a visit to Germany last September.

cent of the total made, will be deemed sufficient cause for disqualification.

Awards: Certificates to the top scorer in each state, Canadian province and DX country. Additional awards if the score or participation warrants.

A Plaque will be awarded by *CQ* to the single operator station having the highest score.

Hawaii and Alaska will be considered as "DX countries" for QSO and multiplier credit. The District of Columbia counts as Maryland. And keep in mind that VE1 is divided into three provinces, Nova Scotia, New Brunswick and Prince Edward Island.

Log sheets and United States Regulations for 160 may be obtained from *CQ*, include a large s.a.s.e. with sufficient postage with your request. (See last month's CALENDAR for regulations).

Mailing deadline is February 29th to: *CQ* 160 Contest, 14 Vanderventer Ave., Port Washington, L.I., N.Y. 11050.

French DX Contest

C.W.—Jan. 29-30 **Phone**—Feb. 26-27

Starts: 1400 GMT Saturday

Ends: 2200 GMT Sunday

You may work French stations, stations in French territorial areas (9Q, 9U, 9X and etc.) and ON, LX and HB stations also in this one.

Exchange: The RS/RST report plus a progressive QSO number starting with 001.

Scoring: Each QSO counts 3 points. You earn a multiplier of 1 for each French department (95), each DUF country, each Belgium province (9), each Swiss canton (22) and LX worked on each band. (French stations will indicate their dept. by 2 figures after their call.)

Final Score: Total QSO points from all bands times the sum of the multiplier from each band.

Awards: Certificates to the top scorers in each country and US call areas. Contest contacts may also be applied for the many French awards: DUF, DPF, DDFM and DTA.

This year contest logs go to: The REF Traffic Manager: Lucien Aubry, F8TM, rue Marceau 53, 91 Palaiseau, France.

Editors Notes

The DX Department of *CQ* were busy little bees last September and October. Our DX Editor took three Trophies with him on his trip to Germany, and I had four to present at the DXCC meeting near Boston.

There were probably more contest awards handed out at the Northeast DXCC Round-up in Waltham, Mass. than in any other event in these parts for some years. Besides the usual certificates, of which there were many, three of the fellows hit the jack pot and were awarded Plaques and Trophies. The photos on these pages give a more detailed description.

You will note that we have switched to a new type Trophy, pewter bowls for the Phone Contest, and pewer trays for the c.w. section. It was our feeling that the old "loving cup" we have been giving for the past 14 years had outlived its appeal. We think you will like the new image. (The foreign donors however present trophies of their own design.)

I was going to announce that we had finally caught up with the back-log and that all certificates were on the way to you, only to be stymied by a dock strike that has placed an embargo on all overseas surface mail at this writing. You just can't win,

73 for now, Frank W1WY

STATEMENT OF OWNERSHIP, MANAGEMENT AND CIRCULATION (act of August 12, 1970: Section 3685, Title 39, United States Code) (1) Date of Filing - September 30, 1971; (2) Title of Publication - CQ/THE RADIO AMATEUR'S JOURNAL; (3) Frequency of Issue - Monthly; (4) Location of Known Office of Publication - 14 Vanderventer Avenue, Port Washington, New York 11050; (5) Location of Headquarters or General Business Offices of the Publishers - 14 Vanderventer Avenue, Port Washington, County of Nassau, New York 11050; (6) Names and Addresses of Publisher, Editor and Managing Editor - Publisher: Richard A. I certify that the statements made by me above are correct and complete. (Signed) Richard A. Cowan, Publisher.

CQ BOOK SHOP

Ham's Interpreter

This valuable book is imported from Germany and written by DL1CU. It contains a collection of phrases and expressions designed to assist those amateurs who wish to enlarge their knowledge of various languages for use on amateur radio. It is a must for every DX'er. $1.50

CQ Binders

Convenient and economical are the words for CQ's beautiful maroon and gold binders. Individual issues can be removed quickly and easily without damage to the magazine. Save precious time as reference copies are within immediate reach in this handy binder. $5.00

The New RTTY Handbook

A treasury of vital and "hard-to-get" information, this book is loaded with valuable equipment schematics, adjustment procedures, etc. A boon to beginner and pro. A special section on getting started, written by Byron Kretzman, W2JTP, a well-known authority in the field. $3.95

Surplus Schematics

Ken Grayson has loaded this book with schematics for currently popular pieces of conversion gear, making it invaluable to amateurs as a guide to surplus gear. $2.50

Antenna Roundup I

Edited by Art Seidman, a 160 page mass of antenna information directed at answering a multitude of questions surrounding the mysterious antenna. $3.00

Antenna Roundup II

Ten big theory articles backed up by 82 detailed and illustrated construction projects from VLF to microwave, long wires to 17 element beams and Sterba Curtain arrays. $4.00

Shop & Shack Shortcuts

A volume packed with hundreds of hints & shortcuts collected by Don Stoner, this will help anyone to dress up his shack, improve shop techniques and increase efficiency and equipment. $3.95

CQ Anthology II

1952-1959 250 pages of more recent but still hard-to-get important articles from glorious yesteryear. $3.00

Electronic Circuit Handbook I

Written by Tom Kneitel, WB2AAI, this details 150 of the most often needed circuits in 11 great chapters. Invaluable for beginners and old-timers alike. $3.00

Electronic Circuit Handbook II

Tom Kneitel's own sequel to Vol 1, this volume delivers 159 additional circuits that will appeal to all amateurs. Each circuit is fully described in text with complete schematics. $3.00

Surplus Conversion Handbook

Compiled by Tom Kneitel, WB2AAI, this contains 192 pages of conversion articles, covering almost every piece of surplus gear worth the effort to convert to ham use. $3.00

Antenna Handbook I

All new information on transmission line theory, Attenuation, Impedance, Standing waves, Resonant and nonresonant lines, current distribution, free space 3 dimensional patterns of long wires of all practical length and much, much more by Ken Glanzer. $4.00

The New DX Handbook

Don Miller's 200 pages of valuable technical information and operating aids, most of which has never been published before and can be found in no other volume contains Great Circle Bearing Charts. $5.00

RTTY From A To Z

This new RTTY Classic has been produced to fill the gaps in RTTY knowledge among amateurs and professionals alike. 16 chapters and 224 pages. This book is a must in your technical library. $5.00

103 - Simple Transistor Projects

The aim of this book is to familiarize the beginner and advanced experimenter with the handy source of reference circuits. **$3.45**

SURPLUS sidelights

BY GORDON ELIOT WHITE*

THE march to solid-state receivers with fantastic stability, continues. This month I want to describe a general coverage unit built by RF Communications Inc., Rochester, New York, that has been bought by several federal agencies, and prematurely surplused in a few cases.

The RF-505 receiver is not yet common in surplus, but it should be a real beauty when numbers begin to appear. It rivals such standby sets as the Collins' 51J4, R-390 and R-390-A, with considerably less bulk, and with super-accurate tuning.

As the front-panel layout indicates the 505 is digitally-tuned. The accuracy of the voltage-controlled, phase-locked oscillators makes a dial unnecessary, or other readout devices usually found on general-coverage receivers. On this unit you merely set in the desired frequency on six knobs, the first calibrated in three ten-megahertz steps, and the other five marked from zero to nine, for 1 MHz, 100 kHz, 10 kHz, 1 kHz and 100 Hertz digits.

The 1 kHz dial may be pulled out to activate a variable-frequency oscillator to allow interpolation between 100 Hertz points.

Accuracy of tuning is specified within five parts in 10^8 using a high-stability oven for the oscillator. "Ordinary" accuracy is one part in 10^6.

While the digital tuning and phase-locked oscillator system provides great accuracy and fast setting to a particular channel, it does offer some inconvenience in scanning across the bands. The bandspread, I calculate, is roughly 2 miles for the 30 megahertz coverage of the 505. If this seems unbelievable, consider that the 100 Hertz knob has to turn about three inches at its circumference to cover 1 kHz, or 90,000 inches to cover 30 MHz . . . I find that the R-390 receivers cause wrist fatigue, compared to slightly faster tuning sets such as the Hammarlund SP-600, but the RF-505 would be a beast to tune around with, except over a very narrow range. For net work it would be beautiful, I'm sure.

Fig. 1 shows the rather complex block-diagram of the 505, indicating its dual-conversion design, with unique up-conversion to a 156 MHz first intermediate frequency, and subsequent down-conversion to a 500 kHz second i.f.

The receiver is rated to cover 1.6 MHz to 30 MHz, but will receive signals down to 100 kHz with reduced sensitivity. Reception is of course upper or lower sideband, independent sideband, a.m., or c.w. The receiver does very well in almost every mode—audio, RTTY, FAX, etc., when equipped with the proper demodulator units.

The oscillator is fully synthesized and the entire set is solid-state throughout. Coverage, without interpolation is of 284,000 channels in the above-mentioned 100 Hertz steps. Sensitivity is rated at ½ microvolt for 10 db signal plus noise to noise ratio. Audio output, on two separate lines, is 600 ohms, up to 3 watts.

Power may be a.c., 100 to 260 volts, 48 to 1000 Hertz. D.c. input of from 10-40 volts may also be used. Power drain is a maximum of 60 watts.

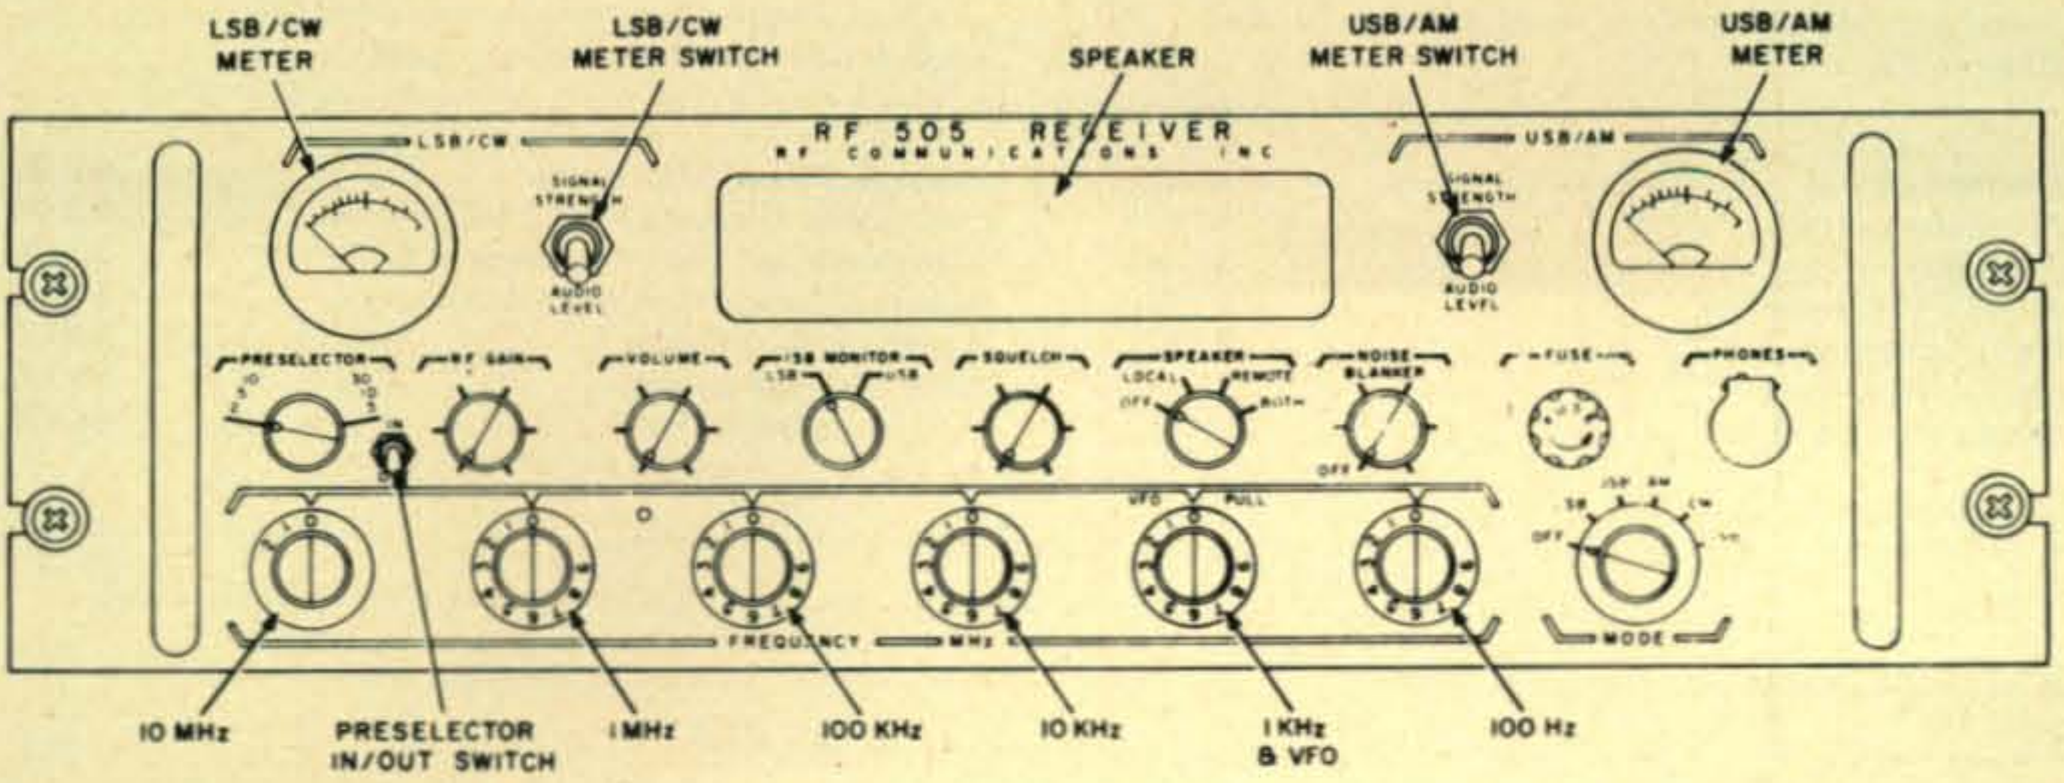
The unit is divided into five major modules, in addition to the main chassis: receiver, synthesizer, power supply, frequency standard, and preselector.

Optional accessories include a noise blanker and c.w. filters.

The set weighs 29 pounds and may be mounted in a 19 inch rack or used in a desktop configuration.

R.f. input is via a BNC connector, and is nominally 50 ohms. ■

*1502 Stonewall Rd., Alexandria, Va., 22302.



Front panel design for the RF Communications RF-505 receiver.

F.M. [*from page 48*]

Solid State COR

K5FOG (Arlington, Texas), better known as "Foggy Joe" has been using a solid-state COR for several months with considerable success. Although Joe is using it primarily with Motorola receivers and power supplies the circuit can be adapted by adding resistance at point X to work with virtually any other type of equipment. The circuit is simplicity. The large value of capacitance from the 6 v.d.c. line is needed when used with the Motorola power supplies because the 6 v.d.c. line is normally used only to power relays and has little filtering. When used with other supplies this may not be needed. Again this is for the builder, but it should appeal as a first project for the new f.m'er.

Corrections

The caption under the photograph of the La Porte, Indiana, .22-.82 repeater in the November issue should indicate that it is on the property of the Conrad Corporation, not Concord. Jim Conrad, K9LHC, and his father have been friends of this columnist since high-school, and I know what the company name is. Just one of those type-setting errors. Sorry Jim.

Also, while looking back at the crystal frequencies on page 52 of the April, 1971, issue, a group of errors were discovered. The column headed Fc-8 is 10 kHz low from the 146.88 frequency down. The last two digits should be the same as those of the columns to either side. This one is definitely my fault, for I copied that column from my records and copied it wrong.

News

Response to the Repeater Directory was simply great. It will be forth coming very shortly. Thanks to everyone who sent back their cards or passed them on to the proper people. Since the updating will be continuous, anyone who did not receive a card or any new group please let me know. There are plenty left, (in the second printing) and the postage bill is footed by *CQ*.

The Southeastern Repeater Association (SERA) recently elected new officers. The new Spokesman is Ken Kopp, WA4HAA; Secretary is C. F. Stromberg, W4WLX; and Treasurer is Walt Terrie, WA4FBI. Ken and Walt are active supporters of this column, and are very active in f.m. in Florida. Good luck to all the new officers of SERA.

The Indianapolis, Indiana, repeater has been going great guns on 146.34/146.76 for some time. Plans are in the making to move the input down to 146.16 for the standard 600 kHz spacing. The Indianapolis Radio Club, Inc., which sponsors the repeater has an HR2, mobile antenna (magnetic mount), and an a.c. supply to loan for short periods of time to members. This lets the member see if he really wants to get on f.m. before expending the time and effort. W9PSE related the plans for this loaner when I was in Indianapolis last summer. The project has been in operation about 6 months and seems to be working out very well. This type of project may be just what the doctor ordered for general amateur clubs which also operate or sponsor a repeater. The rig doesn't have to be as fancy as the HR-2, but some type of short-term loaner f.m. unit could show the non-f.m. amateur in the club what it is all about.

Still in the state of Indiana, the Central Indiana UHF-VHF Club held a Hamfest on 19 September at Eagle Creek Park in Indianapolis. Among other things, an HR-2A was given away as the main door prize. The winner K9SUW!

As an aid in stirring up 220 MHz activity in the Dallas-Ft. Worth area, this columnist, along with W5URH, WA5TKU, K5FOG, and K9PYB/5, are constructing a repeater with planned input of 220.500 MHz and output of 221.500 MHz. It is hoped that by the time this appears in print that it will be operational from at least a temporary location. Since 220 seems to be the forgotten band, it is only logical to control it on another forgotten band, namely 1296 MHz. Although early control functions will probably be on 450 MHz, the long term plans are for 1296 control.

Amateurs in the United Kingdom are doing

their best to get repeaters legalized. Kris Partridge, G8AUU, recently telephoned the author (boy am I glad I don't have to pay his phone bill, it took three calls to catch me), with information and requests for information. Their first step is convincing the RSGB about repeaters. A meeting was scheduled with the RSGB late in October. Sure hope that everything went OK. Their next step is the British Post Office (which controls like our FCC). Kris passed along some information on f.m. in Germany and on operation in the 4 meter band. The frequencies now primarily in use on the continent are 144.150/145.850 and 144.200/145.900 (1.7 MHz input/output spacing). The frequencies to look for activity on the British 4 meter band (all modes) are 70.260 MHz mobile operation and 70.350 MHz emergency channel.

Several repeater groups have been getting very good newspaper publicity by helping provide communications for parades, charity drives, and other civic projects. If your group helps out, see that the local newspapers know about it. Amateurs need all the good publicity obtainable.

Q & A

Q. Where can I obtain information on my Link model _____ unit?

A. Several requests on various pieces of the older Link equipment have been received. Unfortunately this columnist's library is blank in Link category. Do any readers know of any good sources for information on Link equipment? Motorola and G.E. are pretty well represented, but not so with Link.

Q. A group of local f.m. operators are planning a repeater. What is the best way of finding out the frequencies we can use and avoid interference with others?

A. There are several possible sources of information about frequencies in use in your area. The best way is to contract the officers of the operating repeater(s) to see if there is a coordinating committee in the area. If so, this committee can steer you towards primary and control frequencies. If not, you may want to consider formation of such a committee (comprised of members from each repeater operating or planned). If there are no known repeaters in the immediate locale, look at the various repeater directories (*73* and *QST's* have been published, and *CQ's* will be out shortly). See what frequency combinations are used in cities within a 150 to 200 mile radius. Then pick a standard pair (60 kHz input/output spacing on a 30 kHz channel spacing) which have been agreed upon nationally. If you cannot find any repeaters within the 200 mile radius then use .34/.94 or .34/.76 (depending on trend in your part of the country), or, .16/.76 as some areas are going to. Stay off 146.10/146.70 MHz unless the repeater is going to be for RTTY, for this is the gentlemen's agreed national f.m. AFSK RTTY combination.

Finale'

Well, so ends the beginning of the second year of FM in *CQ*. Suggestions, comments, news items, reader circuits, and, especially, photographs are always needed. Keep up the support and happy f.m'ing, and Happy Holidays. ■

Q & A [*from page 78*]

as this unless one is going to use a sizeable array?

Except for the unsuitability of the Model 400 for use with the tilt-over tower described above, it appears to be a rugged, well-built heavy-duty antenna rotator."

Many thanks, Chek. We had not encountered this difficulty, since our installation was on a tower of a different nature; however, your experiences with the rotator should be a helpful guide for others.

Cross Reference for Transistors

QUESTION: I am searching for a publication that will identify the equivalent transistor designations of the many various transistor manufacturing companies. Can you advise where such a publication may be obtained?

ANSWER: Allied Radio's Industrial Electronics Catalog lists the manufacturers of transistors of a given numerical identification. A cross reference to Motorola HEP types is "Semiconductor Cross-Reference Guide and Catalog," obtainable for 35¢ from Motorola Semiconductors, Box 2953, Phoenix, Arizona 85036.

Bill, W2AEF

QRP Rig [*from page 42*]

set on the sidetone board, not adjustable with the front panel volume pot, yet more than loud enough.

On all of the units a polarity protection series diode is used in the power lead (leaving it out on one of the transmitters allowed the authors to check several types of final transistors after one late evening mistake). The *Handbook* power supply[3] works well for the transmitter, and introduces only minor hum into the receiver.

Construction

Several variations on the same theme were used for the final product as the pictures show, although the bread board for the first versions were in fact a wood board and an

old chassis, used many times for bread boards. All that is needed is a tray to set modules on, either flat or on edge, a front panel to hold the controls, and a back lip for the outputs. The v.f.o. boards as now supplied are in a configuration that must be set flat and broadside to the panel, but this could easily be remedied.[4] For best mechanical stability, the v.f.o. board and the Jackson vernier dial must be mounted to the same platform, but separate from the front panel. This way, the only time mechanical changes affect the v.f.o. is when the v.f.o. knob itself is manipulated. Two types of read-outs for the dial mechanism were used. The turning disk and stationary fiducial mark used in both transmitters is probably best. The National dial excutchion and pointer used on the receiver, although very nice looking, was much harder to get properly centered and does not seem as stable. A calibrated "disk" is given in fig. 5. Mounting the tuning capacitors caused some problem. In one of the transmitters the bottom mounting holes were tapped (4-40) and standoffs from the bottom plate used. This is not the most compact arrangement, although perhaps the most stable. In the other transmitter, and for the receiver "preselector," the already tapped front mounting holes were used, the capacitors being mounted directly to the front panel on quarter inch stand-offs.

One of the transmitters and the receiver were made on a 5 by 7 inch bottom plate, the other transmitter on a 5 by 9 plate, both with 4-inch high front panels and a 1-inch rear lip. Placement of the audio power module and the speaker on a back panel would have been preferable for the receiver, and in fact the back panel in the larger transmitter was an after-thought to accommodate the AC-6 and AC-7 modules. If any of the jacks could be mistaken for each other (if you use RCA phono jacks for power and other functions, as an example), they should be arranged so the power jacks and receiver signal jack (on the transmitter) are clearly separated and marked.

The boxes were made with "cookie sheet" aluminum and small angle aluminum. The angle aluminum was drilled and tapped (4-40), but sheet metal screws would have worked as well. Those not having access to "cookie sheet" cutters and vises to bend the material might use a Bud-type aluminum utility box. The 9 x 6 x 5 or 10 x 8 x 7 units would have room for the complete transmitter and receiver.

Several finishing methods were used. The easiest and probably the most scuff resistant was with "contact" paper, available in a variety of colors — even wood grain. The front panels were washed free of finger prints and machine grease, wiped with vinegar, and sprayed first with zinc chromate and then flat black. Embossed tape labels and transfer letters were used to identify control functions and jacks.

QRP Operation

Without a doubt, this is one of the most fun rigs to operate you can imagine when you think of the combination of QSO's per watt and per dollar. Using an Ultimate Transmatch[5] and a 3/8 wavelength antenna on 80 meters which works well on the other bands, and a sensitive "power meter"[6,7] portable operation on 20-80 is a ball. The home antenna farm makes checking into the local and state nets a cinch. Contacts over the whole country are possible, and occasionally a real DX thrill occurs.

Care must be taken when using a direct conversion receiver to make sure you are on the correct sideband. If you tune up from the bottom of the band with the receiver, then tune down from the top with the transmitter, or vice versa, you will be on the correct sideband, and not 2 kHz or so away. It is generally best to answer CQ's, but calling CQ QRPP also results in a fair percentage of contacts. Remember, the guy at the other end must work just a little bit harder to hear you, especially if there is any QRM.

Fun? You bet! And completely within the FCC dictum on power usage.

The authors wish to thank their many friends in the Richmond area for comments and suggestions on these little rigs. ■

Footnotes

4. Al Kahn of Ten-Tec! indicates that the VO-1 module can be supplied with the tuning capacitor unmounted.

SECRET WEAPON FOR CONTEST'ERS

PROGRAMMABLE! REPROGRAMMABLE!!

EK-402 THE ULTIMATE CW KEYER

FEATURES:

- **Instantly programmable and reprogrammable message memory**
- **Instant transfer between manual and program keying**
- **Exact speed and weight match between manual and automatic keying**
- **20 character memory in three contest groups**
- **Automatic variable repeat cycle**
- **Famous Curtis keying system**
- **All controls on the front panel**

TYPICAL PROGRAM SET:

A. 5NN 03 DE W6HVN K
B. CQ TEST CQ TEST DE W6HVN K
C. DE W6HVN K

SPECIAL
SEE BILL SCHERER'S REVIEW PAGE...34

SPECIFICATIONS:

- 256-bit MOS Read/Write Message Memory
- 1-30 Second Memory Repeat Cycle
- 8-50 WPM Calibrated Speed
- Iambic Keying, Paddle or Squeeze Key
- Variable Character Weight
- Perfect Dot Memory
- 100% "Linear Proof"
- Built-in Sidetone and Speaker; External Volume and Pitch Controls
- Reed Relay keys grid block, cathode keyed or solid state rigs
- Semiconductor Complement: 17 IC's, 6 Transistors, 20 Diodes
- Brushed Panel, Beautiful Heavy-Duty Cabinet
- Furnished ready to go; use your paddle

PRICE:
$289.95

Sunspot Story [*from page 32*]

expected to be at their best during the upcoming period of low solar activity. Some fairly good DX openings should be possible to some areas of the world during the hours of darkness and the pre-dawn period of the early spring, late fall and winter months. An occasional DX opening may also be possible during the nighttime hours of the rest of the year as well.

In spite of lower solar activity, solar absorption will still rule out the possibility of daytime DX openings on 40, 80 and 160 meters.

In summary, low solar activity is expected to prevail throughout most of 1972. It should be a fairly good year for DX propagation on 15 and 20 meters during the daylight hours, and on 40 and perhaps 80 meters during the hours of darkness. ■

Curtis Keyer [*from page 35*]

grams. These occur in the sequences shown.

Each quadrant in the memory system stores only *one* piece of information. The data in each and the sequences of the quadrants cannot be interchanged between programs. Figure 2 shows where the only variations may be had between program material (that at X and Y).

Program Writing

The programs are written in the following way:

Referring to fig. 3, with the switches set at appropriate positions the first section (quadrant X) of program A is written by initiating the start and operating the keyer during the first period between when the quadrant lamp extinguishes and re-lights. For example: at fig. 2 CQ CQ would be sent during this period. Further writing of this program is not needed until the program cycle is completed (as indicated when the CYCLE-COMPLETE lamp goes on). The last section of program A does not have to be written at this time, as it will be recorded automatically during the writing of program B. Instead of waiting until the cycle is automatically completed, the STOP button may be depressed to do so manually.

Program B is made with the PROGRAM switch set accordingly and initiating the start. As before, the quadrant lamp goes out at the start, but this time the keyer is not operated until the lamp comes on again, indicating the start of the second quadrant Y. The data for Y may then be keyed until just before the lamp extinguishes, indicating the end of the quadrant which in the example contains CQ TEST. When the lamp then goes out, the keying must be resumed to supply the data for quadrant Z which for the case in point will be DE W2XXX K. The data for quadrant Z must be completed before the program cycle is completed as indicated by the CYCLE-COMPLETE lamp.

When the programs are subsequently played back, the data at quadrant Z automatically appears at the end of programs A and B and as the only section of program C. Program C therefore does not have to be written independently. The data in quadrant Y appears as the first *two* sections of program B and that in quadrant X appears only as the first section of A. The data from the different quadrants of the memory setup thus appears on each program as shown at fig. 2.

When a program is written, the clock is free-running, requiring that the operator more precisely times his keying to synchronize it with the clock; however, timing of the memory program is such that a dot or dash is properly entered even if split by late timing. If the key is depressed at *any time* during a bit window, the entry is made properly. This also applies to spaces. The memory thus is quite forgiving of improper timing and will always provide a more nearly perfect playback than the original.

Since the programs are made up of individual sections, it also is necessary to get the data into each quadrant timed so that too much or too little spacing does not occur between sections after they are put together in a program. The timing requirements thus necessitate a bit of practice and can be best accomplished by writing the programs at a speed of 5-10 w.p.m. This we did not find difficult to be carried out.

The EK-402, like its predecessors, is built on printed-circuit boards contained in a neat metal cabinet. Phono-type jacks are provided for all connections, except for the detachable power cord. The size of the unit is 5″ × 10¼″ × 3¾″ (H.W.D.) and it weighs 4¾ lbs.

For those who would like to "go all out," the EK-402 Programmable Electronic Keyer will well meet the task. It is priced at $289.95, with interconnecting cables, but less keying paddles. It is a product of Curtis Electro Devices, Box 4090, Mountain View, California 94040. —W2AEF

CQ to announce major subscription price increase

$$$ave $$$AVE $$$ave $$$ave $$$ave

The newly announced postal rate increases, coupled with rising costs for printing and labor, will force us to announce a major subscription price increase in the very near future.

In order to protect our regular subscribers, we're making this information known in advance to allow you to order long-term subscriptions and save $$$$. Newsstand prices are already up to $1.00 per month or $12.00 per year. The savings on these long-term subs will be substantial. And when we say long-term, we really mean it. These rates are offered for a limited time only and may be withdrawn at any time.

1 year	$6.00	10 years	$40.00
2 years	$11.00	15 years	$55.00
3 years	$15.00		
5 years	$23.00	Life Subscription	$75.00

As you can see, we've offered a variety of choices that enable every reader, regardless of age, to select the best choice for his own needs. And believe us when we say that the savings will be substantial over future rates. **So don't delay. This offer may be withdrawn very soon.**

Signal Generator [*from page 28*]

the power supply with two single-section 150 mf. electrolytics of the same voltage rating (150 v.d.c.). In addition, the microphone connector originally installed as the r.f. output jack was replaced with a BNC connector to make the generator compatible with other equipment used by the author.

Figure 2 is a drift-rate chart covering a ninety minute period, commencing with a cold start. The left-hand vertical axis is the frequency ordinate for the 220 MHz curve, and the right axis is the corresponding ordinate for the 14 MHz curve. The chart is intended to indicate only the magnitude and rate of drift with respect to time; the actual direction of drift was downward in frequency. It is obvious from the chart that the equipment is quite unstable when first energized; however, after a sixty minute warm-up, stability is sufficiently good to allow the equipment to be used. It is interesting to note that although the drift rate at 220 MHz is almost zero after ninety minutes, at 14 MHz the equipment is still drifting slowly (about 1 to 2 kHz every 10 minutes). The only explanation the author can offer for this is that the slug-tuned coil used on the lower band (Band E) is gradually changing inductance as the tuning slug and winding heat up. Since the tubes don't generate much heat, temperature stabilization of the coil could take several hours, assuming that ambient room temperature didn't change. At v.h.f. (Band F) this problem doesn't exist because the inductor is a solid copper strip. Proof of this theory can be demonstrated by touching the brass adjusting screw of the Band E coil with a hot soldering iron; the change in frequency is quite drastic. When the iron is removed, the generator will gradually drift back up in frequency as the slug cools down.

The modification described should be well worth the effort for the v.h.f. amateur who can't afford a new signal generator, but needs some sort of signal source for occasional testing. ■

Sonar FM-3601 [*from page 24*]

distortion. The modifications made are not known to the author, but they seem to have improved the receiver audio very much. All spurious responses were well within the 60 db down category except for the second i.f. image 910 kHz above the desired frequency. This response was only 56 db down before and after modification. Fortunately this response is in the little used portion of the 2 meter band. However, it could cause problems in some areas. Adjacent channel rejection was in the neighborhood of 62 db (30 and 60 kHz) when the 20 db quieting method was used.

Construction

Construction of the Sonar FM-3601 is excellent, with epoxy printed circuit boards and excellent workmanship. Disassembly for service is somewhat cumbersome, for the unit splits into two separate but interconnected portions. However there is plenty of uncrowded working space on the boards.

General Comments

The Sonar FM-3601 has many favorable points. Like any other unit it is not perfect. First of all, the channel selectors are not presently set up for strapping. Therefore a separate crystal must be used in each position, adding to expense. The unit comes with 2 146.94 MHz receive crystals which are paired with the 146.34 and 146.94 MHz transmit crystals. The spurious response at F_c + 910 kHz could be a problem at locations with high fm activity. Finally, the lack of a shutdown circuit to protect the final transistor could also cause problems under circumstances. Also, the need to disassemble the unit to replace and zero the crystals is a disadvantage.

Now, on the positive side, the Sonar FM-3601 is one of the best looking units on the market. The styling is quite attractive, and thus wife pleasing. Next, the construction and workmanship are among the best units seen by the author. The unit is quite easy to remove from the vehicle and use in the house as a base station with the optional a.c. supply unit. The instruction manual is one of the best seen to date. It includes complete alignment instructions, parts lists, and test hints. An easy-to-read schematic with voltage readings is also included. A complete set of pictorial drawings are all that is needed to make the Sonar manual complete.

The Sonar FM-3601 sells for $299.95 with microphone, d.c. power cable, installation hardware, mounting bracket, and crystals for 146.34/146.94 MHz repeater operation and 146.94 MHz simplex. The optional a.c. power supply model PS-2923 is $39.95. Information is available from Sonar Radio Corporation, 73 Wortman Avenue., Brooklyn, N.Y. 11207. —*K9STH/5*

DRAKE TR-4

The ultimate in SIDEBAND TRANSCEIVER performance

$599.95

34-PNB Plug-in Noise Blanker . . . **$100.00**

RV-4 Remote VFO for TR-4 . . . . **$110.00**

GENERAL: • **All amateur bands** 10 thru 80 meters in seven 600 kc ranges • **Solid State VFO** with 1 kc dial divisions • **Modes** SSB Upper and Lower, CW and AM • **Built-in Sidetone** and automatic T/R switching on CW • **30 tubes and semi-conductors** • **Dimensions:** 5½"H, 10¾"W, 14⅜"D. **Wt.:** 16 lbs.

TRANSMIT: • **VOX or PTT** on SSB or AM • **Input Power:** SSB, 300 watts P.E.P.; AM, 260 watts P.E.P. controlled carrier compatible with SSB linears; CW, 260 watts • **Adjustable pi-network.**

RECEIVE: • **Sensitivity** better than ½ uV for 10 db S/N • **I.F. Selectivity** 2.1 KHz @ 6 dB, 3.6 KHz @ 60 dB. • **AGC** full on receive modes, variable with RF gain control, fast attack and slow release with noise pulse suppression • **Diode Detector** for AM reception.

R. L. DRAKE COMPANY — DRAKE® — **540 Richard Street, Miamisburg, Ohio 45342**

THE CLEANEST TALK AROUND

The AutoLevel is the first major breakthrough in volume processing in years. This unique device regulates the input signal to provide *14 db* of compression. It is ideally suited to SSB and AM and may be used with ALC systems. A built-in bypass switch allows you to feed the microphone straight through. Provision is also made for push-to-talk operation. The AutoLevel is not a *clipper compressor - all regulation is accomplished with a fast-acting photosensitive resistor that electronically regulates the input with a minimum of distortion.* If you would like to increase your average output and still maintain a clean signal, the AutoLevel is the volume compressor for you . . .

Features:

- 14 db of compression (minimum)
- 115-volt ac power supply
- Input bypass switch
- All silicon transistors
- G-10 fiberglass printed circuit board
- Simple installation (installs in microphone lead).
- Price: $87.50

Finally the application from Al, VK4SS arrived, No, it had not been sent via air mail and apparently was badly delayed by the (U.S.) West coast strike that lasted at least 3 months. In the past 7 years, to my knowledge, only one application failed to arrive and that one was apparently destroyed by fire in the mail box at the point of origin (and it was for All Counties).

To repeat for the new County Hunters, yes I am the custodian for the *CQ*, United States of America Counties Award (USA-CA) and your *first* application must be made using the USA-CA Record Book which you obtain direct from *CQ* for 1.25 (postage paid). To save time, all other mail regarding the USA-CA Program should be addressed to my home QTH.

A reminder to all County Hunters about the two QSL Bureaus—for complete data send s.a.-s.e. to ICHM QSL Agency (W6CCM) P.O. Box 146, Lakeside, California 92040 and/or to The QSL Clearing-House for County Hunters (WA2AEA) 4 Pinewood Circle, Corning, N.Y. 14830.

Happy New Year for You & Yours! How was your month? 73, Ed., W2GT.

Annobon [*from page 20*]

as of the friendly people of Guinea and its splendid President. We set course towards old Europe, Madrid, Paris, Amsterdam and finally to Helsinki. We had experienced the DX-pedition of the century with all its amusing memories and warm receptions. 15,000 radio amateurs were sharing the four weeks with us—and will receive a QSL card each.

We would like to express our sincere gratitude to PY2PE, DJØKQ, F9RM, K6LOM, W6AOA, EA4JL, EA4LH, TY1ABE and INDXA for showing outstanding ham spirit and contributing to making "the dream of Annobón" come true.

This story seemed to follow the rule: if the end is well, all is well. But not alltogether. Out of the four types of African malaria we got three—struggled four days through 110° F fever, spent four long weeks in hospital and still have the malaria organisms in us. We were also taken aback by the news of the violent murder of the American diplomat whom we had met and of the nervous breakdown of Mr. Erdos whom I mentioned in the story. There are many DX-stories being told —here we are with one of them... ■

DX [*from page 68*]

certain score, you receive a badge showing you to be a 'Master of the Radio Sport.' This is technically the exact equivalent of 'Master of Chess', but since chess is so highly regarded in the Soviet Union they are probably not equal in the public eye."

We hope to be able to follow this up with a Part II of Amateur Radio in the U.S.S.R. in a future issue.

160 Meter News

Another great moment in top band DX history took place last *summer* when Herb, KV4FZ, completed WAC, Worked All Continents, on 160 in just one day. Everybody told me that you couldn't work much DX on 160 in the summertime, but here's how it went at KV4FZ on Aug. 16, 1971:

Asia—MP4BJI at 0207 GMT
Europe—GW4AEC at 0209 GMT
Australia—VK6HD at 1001 GMT
Africa—ZD8AY at 2356 GMT
South America—PY1DVG at 2358 GMT
North America—WA4PXP at 2359 GMT

The tough one from KV4 was working John, MP4BJI (ex-VP9GJ). Congratulations Herb.

MORE GREAT BUYS FROM ARROW

TEN-TEC

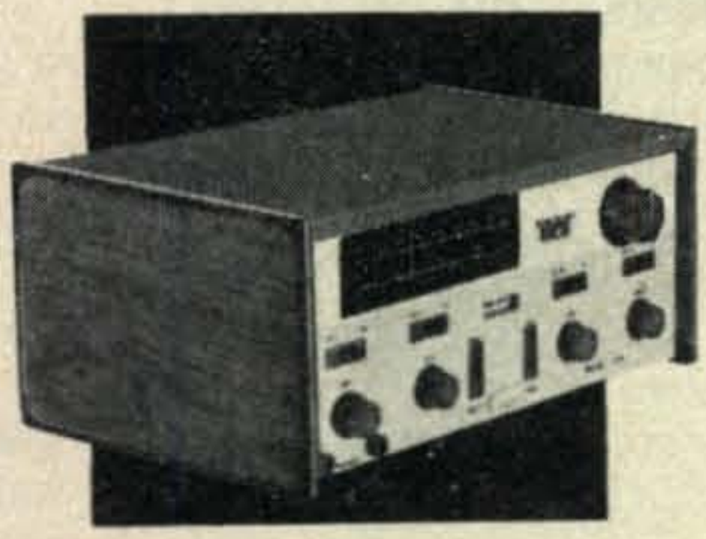
POWER-MITE TRANSCEIVERS

PORTABLE / LOW POWER / LOW COST

Put more adventure into Amateur Radio

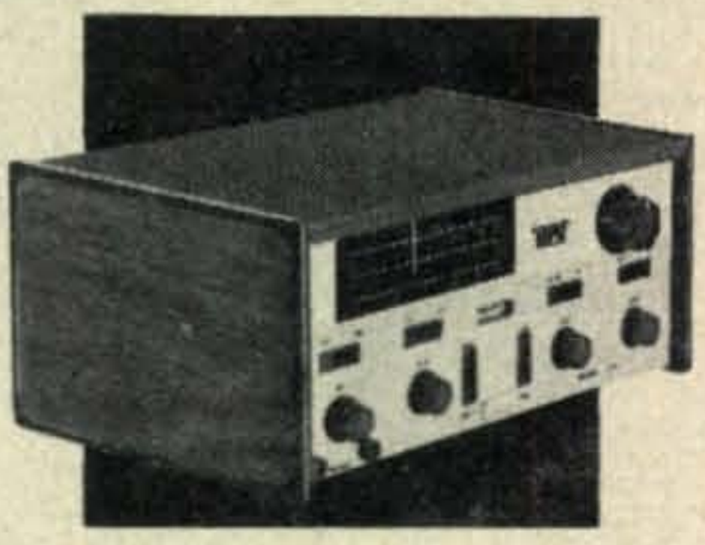
The Power-Mite includes a Synchrodyne direct conversion receiver and solid state CW transmitter. Drift is less than 100 Hz. Adequate receiver sensitivity even for "down under" DX signals. An "M" derived filter provides 2 KHz selectivity. Built-in side-tone, receiver muting. Integral break-in keying with adjustable delay (PM 3A only) makes operating virtually effortless. Keying is clean and wave shaped for easy copy.

A compact Power-Mite transceiver excels as a traveling companion. It needs only an antenna, key, headphones and a lantern battery for instant CW communication wherever you are.



POWER-MITE PM 3 $69.95
POWER-MITE PM 3A $79.95

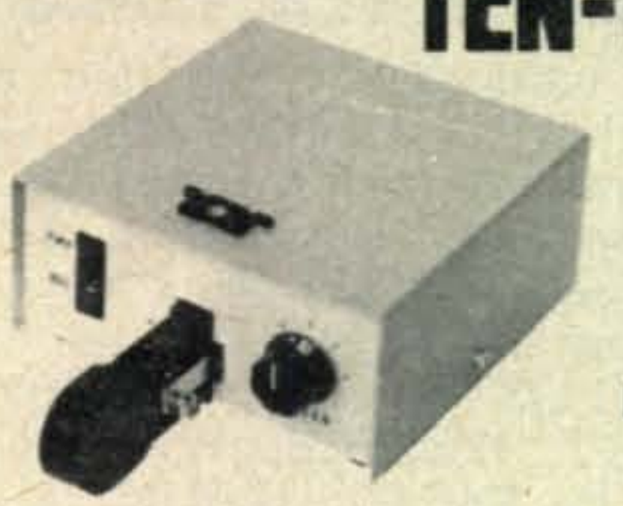
Old timers who are a little bored with high power are finding the Power-Mite a refreshing challenge. Beginners experience all the thrills of conquering distance and making new friends.



PM 2 ..... **$54.95**
PM 2A (with side-tone) **$59.95**
PM 2B (with side-tone and 20 meters) **$65.95**

Ideal for the Novice, portable operation, QRP work and emergency service. It may be used to drive a linear amplifier.

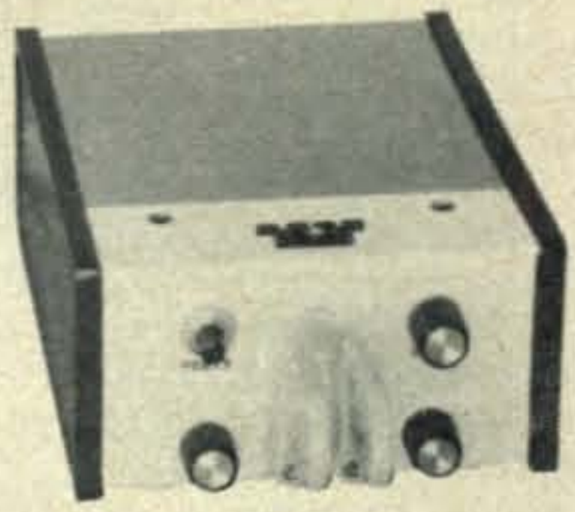
TEN-TEC KEYERS



MODEL KR5

The KR5 embodies a new principle in paddle construction. It provides action usually associated with higher priced instruments. Operates from 12 volt DC source. Self-completing characters. Fixed factory adjusted paddle return and weight ratio. Ideal for fixed or mobile station.

KR5 **Price $34.95**



MODEL KR20

A popularly priced line keyer without the squeeze feature. Excellent "feel" for smooth, easy to copy CW at any speed. Self completing characters. Side tone. Two position weighting control.

KR20 **Price $59.95**
Keyer less paddles

KA20 **Price $44.95**

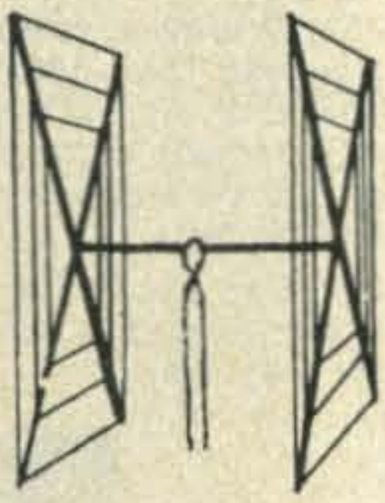
AN INDESTRUCTIBLE ANTENNA OF INFINITE GAIN, FOR FREE ?

No, not yet, but we are working on it. Right now, the nearest we have come to the ultimate in strength, performance and low price are the antennas listed below. Every one is thoroughly researched as to design; constructed of the finest components; fully tested on the air for maximum performance; repeatedly assembled to arrive at the fool-proof instructions; truthfully advertised; and sold at fantastically low prices.

QUADS

Worked 42 countries in two weeks with my Gotham Quad and only 75 watts...



W3 CUBICAL QUAD ANTENNAS — these two element beams have a full wavelength driven element and a reflector; the gain is equal to that of a three element beam and the directivity appears to us to be exceptional! ALL METAL (except the insulators) — absolutely no bamboo. Complete with boom, aluminum alloy spreaders; sturdy, universal-type beam mount; uses single 52 ohm coaxial feed; no stubs or matching devices needed; full instruction for the simple one-man assembly and installation are included; this is a fool-proof beam that always works with exceptional results. The cubical quad is the antenna used by the DX champs, and it will do a wonderful job for you!

10/15/20 CUBICAL QUAD SPECIFICATIONS

Antenna Designation: 10/15/20 Quad
Number of Elements: Two. A full wavelength driven element and reflector for each band.
Freq. Covered: 14-14.4 Mc. 21-21.45 Mc. 28-29.7 Mc.
Shipping Weight: 28 lbs. Net Weight: 25 lbs.
Dimensions: About 16' square.
Power Rating: 5 KW.
Operation Mode: All
SWR: 1.05:1 at resonance
Gain: 8.1 db. over isotropic
F/B Ratio: A minimum of 17 db. F/B
Boom: 10' long x 1¼" O.D.: 18 gauge steel; double plated; gold color
Beam Mount: Square aluminum alloy plate incorporating four steel U-bolt assemblies. Will easily support 100 lbs. Universal polarization.

Radiating Elements: Steel wire, tempered and plated, .064" diameter.

X Frameworks: Each framework consists of two 12' sections of 1" OD aluminum 'hi-strength' (Revere) tubing, with telescoping ⅞" tubing and short section of dowel. Plated hose clamps tighten down on telescoping sections.

Radiator Terminals: Cinch-Jones two-terminal fittings

Feedline (not furnished); 52 ohm coaxial cable

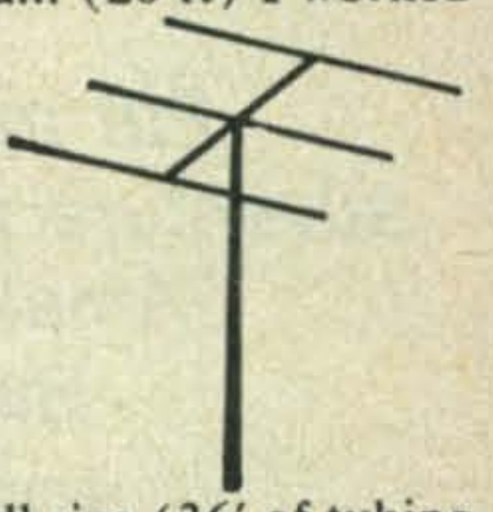
Now check these startling prices—note that they are *much lower* than even the bamboo-type:

10-15-20 CUBICAL QUAD	$37.00
10-15 CUBICAL QUAD	32.00
15-20 CUBICAL QUAD	34.00
TWENTY METER CUBICAL QUAD	27.00
FIFTEEN METER CUBICAL QUAD	26.00
TEN METER CUBICAL QUAD	25.00

(all use single coax feedline)

BEAMS

The first morning I put up my 3 element Gotham beam (20 ft) I worked YO4CT, ON5LW, SP9-ADQ, and 4U1ITU THAT ANTENNA WORKS! WN4DYN Compare the performance, value, and price of the following beams and you will see that this offer is unprecedented in radio history!



Each beam is brand new; full size (36' of tubing for *each* 20 meter element, for instance); absolutely complete including a boom and all hardware; uses a single 52 or 72 ohm coaxial feedline; the SWR is 1:1; easily handles 5 KW; ⅞" and 1" alumnium alloy tubing is employed for maximum strength and low wind loading; all beams are adjustable to any frequency in the band.

2 EL 20	$21	4 EL 10	20
3 EL 20	27	7 EL 10	34*
4 EL 20	34*	4 EL 6	20
2 EL 15	17	8 EL 6	30*
3 EL 15	21	12 EL 2	27*
4 EL 15	27*		
5 EL 15	30*		

***20' Boom**

ALL-BAND VERTICALS

"All band vertical!" asked one skeptic. "Twenty meters is murder these days. Let's see you make a contact on twenty meter phone with low power!" So K4KXR switched to twenty, using a V80 antenna and 35 watts AM. Here is a small portion of the stations he worked: VE3FAZ, T12FGS, W5KYJ, W1WOZ, W2-ODH, WA3DJT, WB2FCB, W2YHH, VE3-FOB, WA8CZE, K1SYB, K2RDJ, K1MVV, K8HGY, K3UTL, W8QJC, WA2LVE, YS1-MAM, WA8ATS, K2PGS, W2QJP, W4JWJ, K2PSK, WA8CGA, WB2KWY, W2IWJ, VE3-KT. Moral: It's the antenna that counts!
FLASH! Switched to 15 c.w. and worked KZ5-1KN, KZ5OWN, HC1LC, PY5ASN, FG7XT, XE2I, KP4AQL, SM5BGK, G2AOB, YV5-CLK. OZ4H. and over a thousand other stations!

V40 vertical for 40, 20, 15, 10, 6 meters	$14.95
V80 vertical for 80, 75, 40, 20, 15, 10, 6 meters	$16.95
V160 vertical for 160, 80, 75, 40, 20, 15, 10, 6 meters	$18.95

GOTHAM
1805 Purdy, Dept. CQ, Miami Beach, Fla. 33139

"HOW TO ORDER: Send money order (bank, store, or United States) in full. We ship immediately by best way, charges collect. DEALERS WRITE."

The Yaesu FTdx 560 Transceiver.
560 watts PEP SSB. 500 watts CW.
$490 complete.
All you add is mike, speaker and antenna.

ncredible.

At $490 the Yaesu FTdx 560 is an incredible buy. It would be impossible if weren't for a couple of facts. One, the aesu is made in Japan; two, it's sold irect to you—eliminating the big dealr's profit.

These days, when you think of Japnese-built products, think of Nikon, or ony, or Toyota. And Yaesu. Our transeivers are state-of-the-art engineered nd carefully hand-assembled. They're o solid, stable and reliable we guarantee them for one year. Yaesu is quite kely the best transceiver made anyhere in the world today.

The complete Yaesu story is a long ne. So we've compiled a comprehenive information packet that gives you he complete picture. Including things ke comparative detail photos, a schehatic, and a comparison chart that shows you the FTdx 560's superiority over rigs you're more familiar with. Once you've looked over the FTdx 560 literature we think you'll agree that the amateur operator's impossible dream has become an incredible fact.

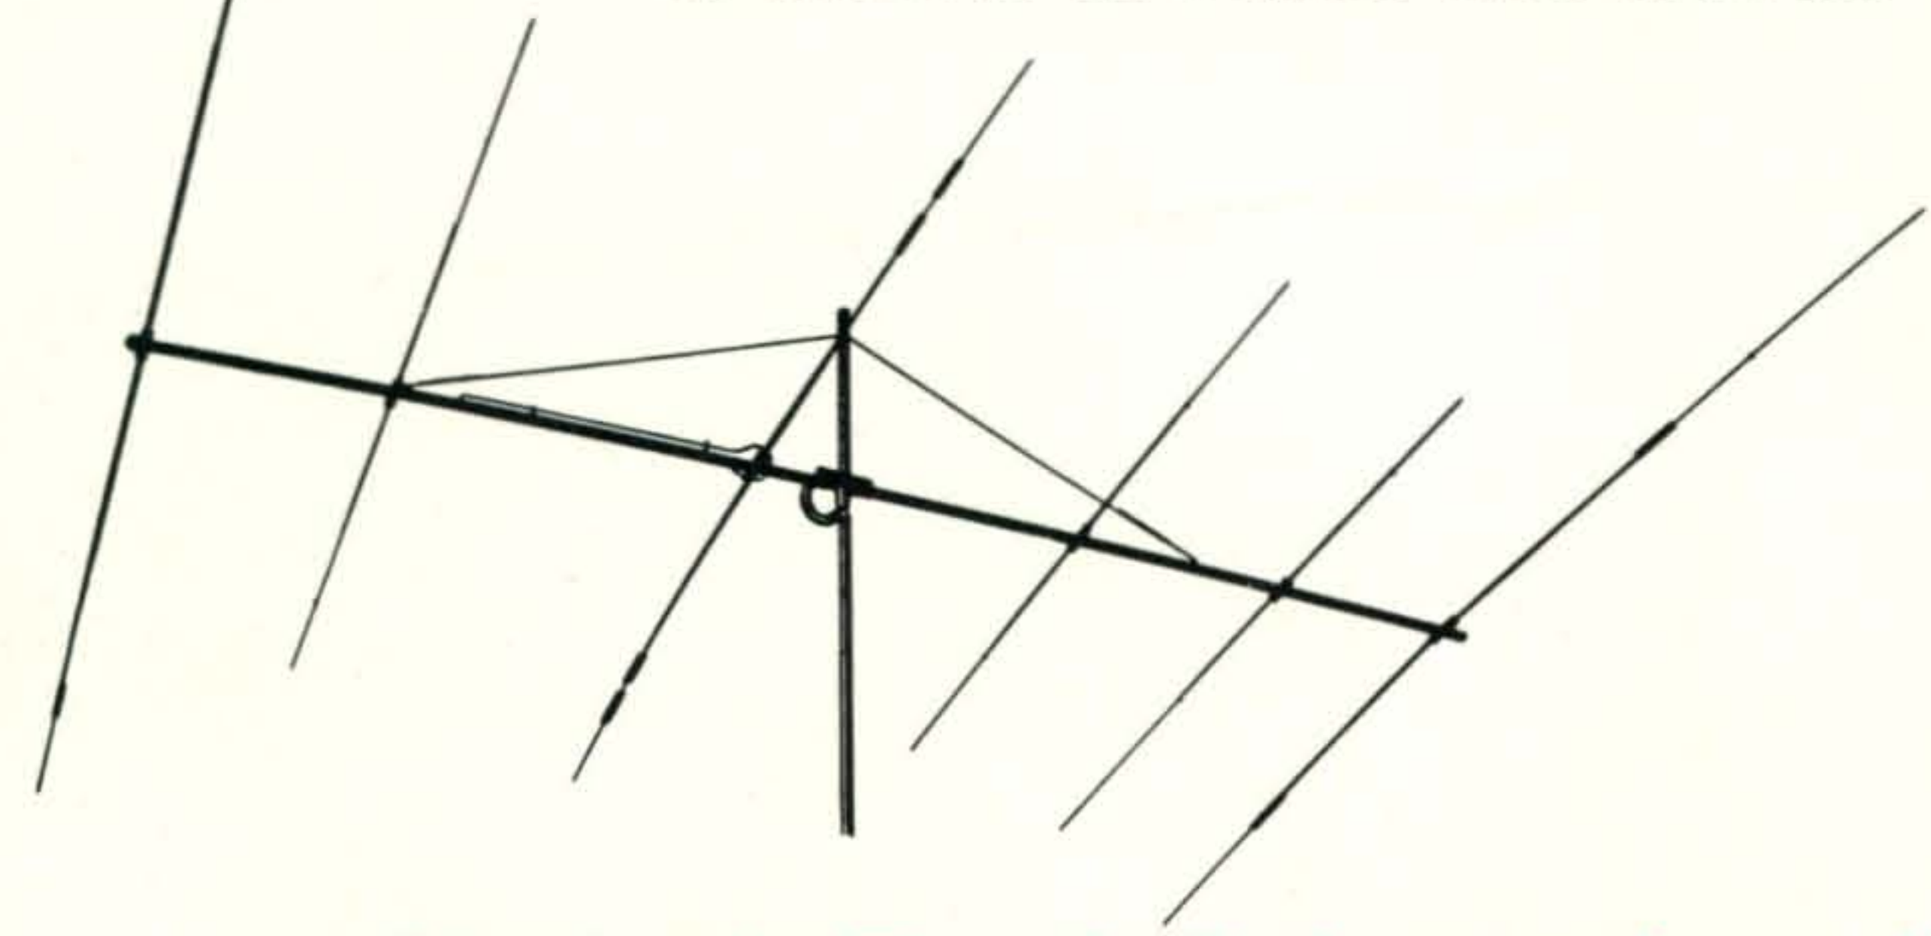
The voice of

HY-GAIN'S THUNDERBIRD 10-15-20

is heard around the world



Here's why Thunderbirds outperform all other tri-banders:

- **Thunderbird's "Hy-Q" traps** provide separate traps for each band. "Hy-Q" traps are electronically tuned at the factory to perform better at any frequency in the band—either phone or CW. **And** you can tune the antenna, using charts supplied in the manual, to **substantially** outperform any other antennas made.
- **Thunderbird's superior construction** includes a new, cast aluminum, tilt-head universal boom-to-mast bracket that accommodates masts from 1¼" x 2½". Allows easy tilting for installation, maintenance and tuning and provides mast feed-thru for beam stacking.

  Taper swaged, slotted tubing on all elements allows easy adjustment and readjustment. Taper swaged to permit larger diameter tubing where it counts! And less wind loading. Full circumference compression clamps are mechanically and electrically superior to self-tapping metal screws.
- **Thunderbird's exclusive Beta Match** achieves balanced input, optimum matching on all 3 bands and provides DC ground to eliminate precipitation static.
- Up to 9.5 db forward gain.
- 25 db front-to-back ratio.
- SWR less than 1.5 to 1 on all bands.
- 24-foot boom...none longer in the industry.
- Extra heavy gauge, machine formed, element to boom brackets, with plastic sleeves used only for insulation. Bracket design allows full mechanical support.
- Interlaced, optimum spaced elements for higher gain and better pattern control.
- 3 active elements on 20 and 15 meters. 4 active elements on 10 meters.
