MARCH 2023

- DX From the Edge of Alaska, p. 8
- Results, 2022 CQ WW DX RTTY Contest, p. 14
- Two Antennas... pgs. 33, 38 ...and Two Tuners, p. 59

On the Cover: Herb Krumich, K2LNS, of Bear Creek, Pennsylvania (seen here in shadow only) lowers his 20-meter Yagi on a tram line from the 60-foot level of his tower. Details on page 78.

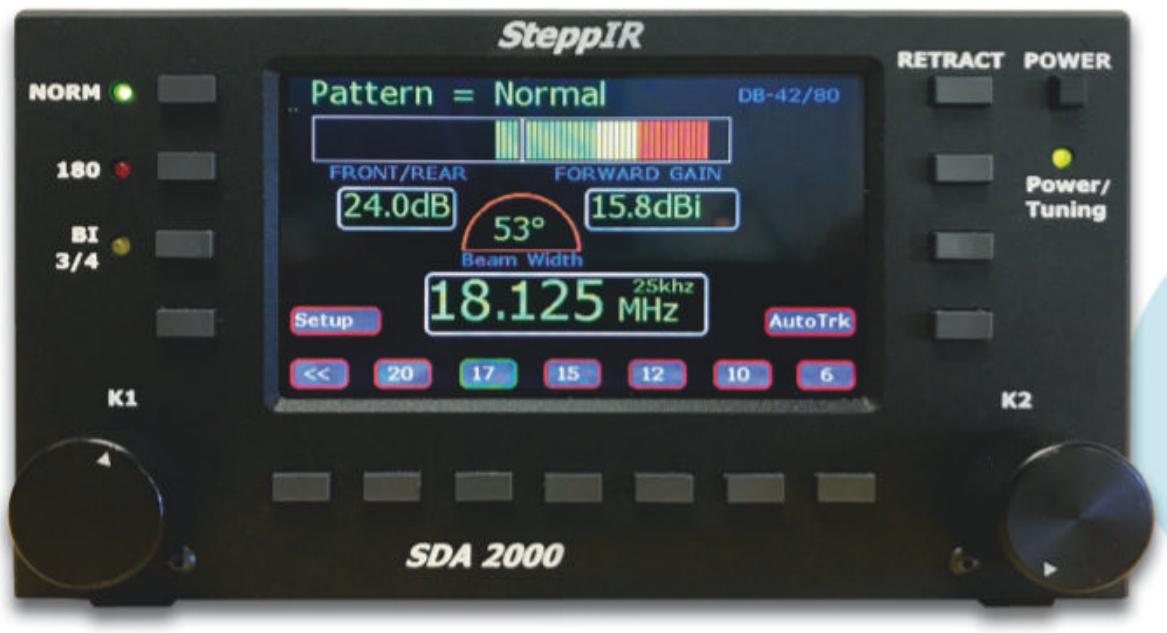
YAGI URBAN BEAM

The distinctive shape and small footprint of the UrbanBeam makes it excellent for use in high density population areas or properties with small lot sizes, where a full-sized Yagi may not be an option.

SMALL FOOTPRINT
BIG DELIVERY

Chantal Villeneuve, upon seeing husband VA2PV Pascal Villeneuve's new UrbanBeam Yagi installed exclaimed, "What a beautiful antenna, it looks like a butterfly"!

The OptimizIR electronic controller is available as an upgrade for all SteppIR antenna products or as a standalone purchase. The perfect pairing with a space saving Yagi Urban Beam!



BI-DIRECTIONAL MODE
Simultaneous gain in opposite directions

180 MODE
Reverse directions at the click of a button

3/4 MODE
Turns the BigIR vertical into a 3/4 wave antenna on 21-54 MHz

MAXIMUM GAIN MODE
Optimized for max gain

MAXIMUM FRONT-TO-REAR MODE
Optimized for best front to rear

OptimizIR

Family owned and operated since 1971

FTDX101MP | *200W HF/50MHz Transceiver*

• Hybrid SDR Configuration • Unparalleled 70 dB Max. Attenuation VC-Tune • New Generation Scope Display 3DSS • ABI (Active Band Indicator) & MPVD (Multi-Purpose VFO Outer Dial) • PC Remote Control Software to Expand the Operating Range • Includes External Power With Matching Front Speaker

FTDX10 | *HF/50MHz 100 W SDR Transceiver*

• Narrow Band and Direct Sampling SDR • Down Conversion, 9MHz IF Roofing Filters Produce Excellent Shape Factor • 5" Full-Color Touch Panel w/3D Spectrum Stream • High Speed Auto Antenna Tuner • Microphone Amplifier w/3-Stage Parametric Equalizer • Remote Operation w/optional LAN Unit (SCU-LAN10)

FT-991A | *HF/VHF/UHF All ModeTransceiver*

Real-time Spectrum Scope with Automatic Scope Control • Multi-color waterfall display • State of the art 32-bit Digital Signal Processing System • 3kHz Roofing Filter for enhanced performance • 3.5 Inch Full Color TFT USB Capable • Internal Automatic Antenna Tuner • High Accuracy TCXO

FTDX101D | *HF + 6M Transceiver*

• Narrow Band SDR & Direct Sampling SDR • Crystal Roofing Filters Phenomenal Multi-Signal Receiving Characteristics • Unparalleled - 70dB Maximum Attenuation VC-Tune • 15 Separate (HAM 10 + GEN 5) Powerful Band Pass Filters • New Generation Scope Displays 3-Dimensional Spectrum Stream

FT-710 Aess | *HF/50MHz 100W SDR Transceiver*

• Unmatched SDR Receiving Performance • Band Pass Filters Dedicated for the Amateur Bands • High Res 4.3-inch TFT Color Touch Display • AESS: Acoustic Enhanced Speaker System with SP-40 For High-Fidelity Audio • Built-in High Speed Auto Antenna Tuner

FT-891 | *HF+50 MHz All Mode Mobile Transceiver*

Stable 100 Watt Output • 32-Bit IF DSP • Large Dot Matrix LCD Display with Quick Spectrum Scope • USB Port Allows Connection to a PC with a Single Cable • CAT Control, PTT/RTTY Control

FTM-300DR | *C4FM/FM 144/430MHz Dual Band*

• 50W Output Power • Real Dual Band Operation • Full Color TFT Display • Band Scope • Built-in Bluetooth • WiRES-X Portable Digital Node/Fixed Node with HRI-200

FT-2980R | *Heavy-Duty 80W 2M FM Transceiver*

• 80 watts of RF power • Large 6 digit backlit LCD display for excellent visibility • 200 memory channels for serious users

FTM-200DR | *C4FM/FM 144/430MHz Dual Band*

• 1200/9600bps APRS® Data Communications • 2" High-Res Full-Color TFT Display • High-Speed Band Scope • Advanced C4FM Digital Mode • Voice Recording Function for TX/RX

FTM-3100R | *Rugged 65W 2M FM Transceiver*

• Rugged & Compact • Crystal Clear Front Panel Audio • 220 Memory Channels • Weather Broadcast Reception • Severe Weather Alert Feature

FT-70DR *C4FM/FM 144/430MHz Xcvr*

• System Fusion Compatible • Large Front Speaker delivers 700 mW of Loud Audio Output • Automatic Mode Select detects C4FM or Fm Analog and Switches Accordingly • Huge 1,105 Channel Memory Capacity • External DC Jack for DC Supply and Battery Charging

FT-5DR *C4FM/FM 144/430 MHz Dual Band*

• High-Res Full-Color Touch Screen TFT LCD Display • Easy Hands-Free Operation w/Built-In Bluetooth© Unit • Built-In High Precision GPS Antenna • 1200/9600bps APRS Data Communications • Supports Simultaneous C4FM Digital • Micro SD Card Slot

FT-65R | *144/430 MHz Transceiver*

Compact Commercial Grade Rugged Design • Large Front Speaker Delivers 1W of Powerful Clear Audio • 5 Watts of Reliable RF Power Within a compact Body • 3.5-Hour Rapid Charger Included • Large White LED Flashlight, Alarm and Quick Home Channel Access

FTM-6000R | *50W VHF/UHF Mobile Transceiver*

• All New User Operating Interface-E2O-III (Easy to Operate-III) • Robust Speaker Delivers 3W of Clear, Crisp Receive Audio • Detachable Front Panel Can Be Mounted in Multiple Positions • Supports Optional Bluetooth® Wireless Operation Using the SSM-BT10 or a Commercially Available Bluetooth® Headset

announcements

MARCH

ROSENBERG, TEXAS — The Brazos Valley Amateur Radio Club will hold the **Greater Houston Hamfest** and **2023 ARRL Texas State Convention** on Friday, March 3 and Saturday, March 4 at the Fort Bend County Fairgrounds, 4310 Texas 36. Phone: (713) 826-6917 or (713) 569-8799. Website: <www.houstonhamfest.org>. Talk-in 146.94 (PL 167.9). VE exams.

TRUSSVILLE, ALABAMA — The Birmingham Amateur Radio Club will hold the **BirmingHAMfest 2023** and **2023 ARRL Alabama Section Convention** from 4-7 p.m., Friday, March 3 and from 8:30 a.m. to 4 p.m., Saturday, March 4 at the Trussville Civic Center, 5381 Trussville-Clay Road. Contact: Rosalind Fazel, KD4ZGO, (205) 853-3220. Email: <rfazel.rf9@gmail.com>. Website: <www.birminghamfest.org>. Talk-in 146.88 (PL 88.5). VE exams.

CAVE CITY, KENTUCKY — The Mammoth Cave Amateur Radio Club will hold the **47th Annual Cave City Hamfest** beginning 7:30 a.m., Saturday March 4 at the Cave City Convention Center, 502 Mammoth Cave Street. Contact: Larry Brumett, KN4IV, (270) 651-2363 or (270) 308-1417 (cell). Email: <lbrumett@glasgow-ky.com>. Website: <http://ky4x.org>. Talk-in 146.35+. VE exams.

CHICOPEE, MASSACHUSSETTS — The Mount Tom Amateur Repeater Association will hold its 34th Annual Amateur Radio & Electronics Hamfest beginning 8:30 a.m., Saturday, March 4 at the Castle of Knights, 1599 Memorial Drive. Contact: Brian Mullarney, N1FI, (860) 478-6790. Email: <n1fi@arrl.net>. Website: <www.mtara.org>. Talk-in 146.94 (PL 127.3). Free VE exams,

DARDANELLE, ARKANSAS — The Arkansas River Valley Amateur Radio Foundation will hold the **Arkansas River Valley Hamfest** beginning 8:30 a.m., Saturday, March 4 at the Dardanelle Community Center, 2059-2099 State Highway 22. Email: <arvhamfest@gmail.com>. Website: <https://tinyurl.com/4pppjp59>. VE exams.

IRVING, TEXAS — The Irving Amateur Radio Club will hold the **Irving Hamfest 2023** from 8 a.m. to 2 p.m., Saturday, March 4 at the Betcha Bingo Hall, 2420 W. Irving Boulevard. Email: <president@irvingarc.org>. Website: <www.irvingarc.org/hamfest>. Talk-in 146.720- (PL 110.9). VE exams.

MCCLELLAND, IOWA — The South West Amateur Radio Club will hold the **SWIARC Hamfest** from 8 a.m. to noon, Saturday, March 4 at 117 Main Street. Email: <hamfest@swiradio.org>. Website: <www.swiradio.org>.

WINDHAM, NEW HAMPSHIRE — The New England Vintage Electronics Club will hold the **New England Vintage Electronics Expo 6** from 8 a.m. to 1 p.m., Sunday, March 5 at the Castleton, 58 Enterprise Drive. Website: <www.nevec.org>.

CONCORD, NORTH CAROLINA — The Mecklenburg Amateur Radio Society will hold the **Charlotte Hamfest** from 3-7 p.m., Friday, March 10 and from 8:30 a.m. to 4 p.m., Saturday, March 11 at the Cabarrus Arena & Events Center-Gold Hall, 4551 Old Airport Road. Phone: (704) 948-7373. Website: <www.charlottehamfest.org>. Talk-in 146.655 or 146.940 (PL 118.8).

ANNANDALE, NEW JERSEY — The Cherryville Repeater Association will hold its **Hamfest and Technology Expo 2023** beginning 8 a.m., Saturday, March 11 at the North Hunterdon Regional High School, 1445 Route 31. Contact Tony Ploski, W2HWW, (908) 256-9568. Email: <aploski@comcast.net> or <w2hww@arrl.net>. Website: <www.w2cra.org>. Talk-in 147.375+ (PL 151.4). VE exams.

BOONVILLE, MISSOURI — The Boonville Amateur Radio Club will hold its Hamfest from 8 a.m. to 1 p.m., Saturday, March 11 at the Zion Lutheran Church, 9171 B Highway. Contact Tom, WAØE, (660) 841-5287 or Dwight, NØQOK, (660) 621-1265. Email: <wa0e@arrl.net> or <dmeyer009@hotmail.com>. Website: <www.w0brc.org>.

GODFREY, ILLINOIS — The Lewis and Clark Radio Club will hold its **2023 Hamfest** from 7 a.m. to noon, Saturday, March 11 at the Lewis & Clark Community College, 5800 Godfrey Road. Email: <hamfest@k9ham.org>. Website: <www.k9ham.org>. Talk-in 145.230- (PL 79.7). VE exams.

KALAMAZOO TOWNSHIP, MICHIGAN — The Southern Michigan Amateur Radio Society will hold the **61st Annual Michigan Crossroads Hamfest & Radio Swap** from 8 a.m. to noon, Saturday, March 11 at the Wings Event Center, 3600 Vanrick Drive. Phone: (269) 815-8007. Email: <smarshamfest@gmail.com>. Website: <www.w8df.com/hamfest>. Talk-in 147.000+ (PL 94.8). VE exams.

PUYALLUP, WASHINGTON — The Mike & Key Amateur Radio Club will hold the **41st Annual Mike and Key Electronics Show & Swap Meet** from 9 a.m. to 3 p.m., Saturday March 11 at the Pavilion Exhibition Hall, Washington State Fairgrounds, 110 9th Avenue SW. Phone: (253) 631-3756. Email: <n7wa@arrl.net>. Website: <www.mikeandkey.org>. Talk-in 146.82- (PL 103.5). VE exams.

RAYNE, LOUISINA — The Acadiana DX Association will hold its **Hamfest & Swapmeet** from 8 a.m. to 2 p.m., Saturday, March 11 at the Rayne Civic Center, 210 Frog Festival Drive. Contact: James Romero, K5CNU, (337) 319-6414. Email: <k5cnu@att.net>. Website: <http://kn5grk.com>. Talk-in 145.410 (PL 123). VE exams.

TULLAHOMA, TENNESSEE — The Middle Tennessee Amateur Radio Society will hold the **MTARS Tullahoma Hamfest** from 8 a.m. to 2 p.m., Saturday, March 11 at the First United Methodist Church, 208 West Lauderdale Street. Contact: Larry Cagle, K4WLO, (251) 680-3250. Email-: <k4wlo@arrl.net>. Website: <www.mtars-ham.org>. Talk-in 146.700- (PL 114.8) or 443.950+ (PL 107.2). VE exams.

ELYRIA, OHIO — The Northern Ohio Amateur Radio Society will hold the **NOARS Winter Hamfest and Computer Show** from 9 a.m. to noon, Sunday, March 12 at the Lorain County Community College-John A. Spitzer Conference Center, 1005 N. Abbe Road. Contact: Carl Rimmer, W8KRF, (216) 256-9624 (before 9 p.m.). Email: <winterhamfest@noars.net>. Website: <www.noars.net>. Talk-in 146.70- (PL 110.9).

FORT WALTON BEACH, FLORIDA — The Playground Amateur Radio Club will hold its **53rd Annual Hamfest** from 4-7 p.m., Friday, March 17 and from 8 a.m. to 2 p.m., Saturday, March 18

(Continued on page 92)

ham radio news

3Y0J On the Air From Bouvet

As we went to press in mid-February, the 3Y0J DXpedition team had landed on Bouvet Island and gotten several stations on the air. Team co-leader Ken Opskar, LA7GIA, reported to media officer Steve Hass, NA2J, that this is "the most extreme expedition I've been to," adding that "Activating Bouvet is not like activating an island in the Caribbean. It is really windy, cold and exhausting to bring equipment up here." Opskar added that the only way to get on shore was by floating 50 feet from the boat in survival suits while holding onto a line attached to a buoy; and that the equipment had to be floated in as well, then carried 800 feet up to the camp.

Early pileups were intense and Facebook was filled with reports of jamming and other bad on-air behavior making it difficult for hams to even hear the team's 100-watt signals. Bouvet Island is a dot of land in the far southern Atlantic Ocean, roughly halfway between South Africa and Antarctica. It is #2 on the DX most-wanted list (North Korea is #1).

Hams Respond to Turkish Earthquake

Early reports following the massive earthquake that rocked Turkey and Syria in early February indicate that ham radio operators there are actively involved in the emergency response efforts. At this writing, the death toll from the quake exceeded 11,000. According to the ARRL, IARU Region 1 (Europe, the Middle East and Africa) Emergency Communications Coordinator Greg Mosup, G0DUB, and others reported that most amateur communications related to the earthquake response in Turkey were on VHF, but that some Turkish transmissions were also heard on 28.540 MHz. According to the IARU Region 1 website, 3.777 and 7.092 MHz are also designated emergency frequencies in Turkey, and IARU Region 2 (the Americas) Emergency Coordinator CO2JC asked hams in the Americas at the time to protect these frequencies while also keeping an ear on them in case assistance can be provided to hams in Turkey. The ARRL report also noted that there is no information on any possible quake-related amateur communications in Syria, as there are very few hams active in the country at this time.

HRO Closes San Diego Store

Ham Radio Outlet has closed its store in San Diego, California. According to a post on its website, the building's landlord informed the company in late 2022 that its lease would not be renewed. "Since that time," said the announcement, "we have been searching the surrounding area for a new location. However, recent extreme increases in rent and non-business friendly policies by the state, county and city governments have made locating and affording a viable location all but impossible." The San Diego store closed permanently on February 25.

Winter Field Day Heats Up the Airwaves

Another Winter Field Day is in the books, the 16th annual running of the event held on the last weekend in January. The purpose of the activity, according to *Newsline*, is similar to that of ARRL Field Day in June, but with the added challenge of practicing portable emergency communication skills in generally less-friendly winter weather. New for this year were a mobile/stationary mobile entry category and a 100-watt power limit for all participants. In 2022, more than 2500 logs were submitted (including those from home stations contacting portable or mobile stations). As of a week and a half after the 2023 event, more than 1900 logs had been submitted from over 1100 locations, with additional logs being accepted through March 1. For more information, visit the WFD website at <www.winterfieldday.com>.

Youth DX Adventure Heading to Curacao Again

Moving ahead to summer, the Dave Kalter Memorial Youth DX Adventure program will again activate call sign PJ2Y from the Curacao QTH of Geoff Howard, PJ2T, this coming July. Participation is open to licensed hams between the ages of 12 and 17; a parent or guardian must also attend. Most trip-related expenses for participants are paid through donations to the YDXA program. The application deadline is May 1. Additional information and application forms are available at <http://qsl.net/n6jrl>.

DXpedition Boot Camp

Keep your ears open later this month for activity from VK9/Norfolk Island, site of the upcoming DXpedition Boot Camp. According to *Newsline*, budding DXpeditioners will get the opportunity to learn from and operate with more experienced ops from an exotic locale between March 17 and 31. The camp, coordinated by Chris Chapman, VK3QB, plans to have stations on the air from 160 through 6 meters, operating CW, SSB and FT8. There will also be an opportunity for a SOTA (Summits on the Air) activation from nearby Mt. Bates. The camp itself is free, but participants have to pay their own travel and lodging expenses. At press time, there was no word on the call sign(s) to be used. For more information as the time grows closer, visit <http://dxpeditionbootcamp.net>.

Morse Makes a Splash on the BBC

The continued popularity of Morse code among hams was the subject of two different programs recently on two different BBC stations in the United Kingdom. *Newsline* reports that the current affairs program "PM on BBC Radio 4" featured Long Island CW Club co-founder Howard Bernstein, WB2UZE, discussing the ongoing appeal of Morse and his club's instruction programs, which are available for free worldwide.

In addition, Mervyn Foster, G4KLE, a volunteer at the Radio Society of Great Britain's National Radio Centre, spoke with BBC Three Counties Radio morning host Andy Collins about the resurgence of interest in Morse in the UK, both within and beyond amateur radio. At press time, both interviews were available online (but it's uncertain how long they'll remain posted). Howard's is at <https://tinyurl.com/326n479a>, and Mervyn's is at <https://tinyurl.com/h9ny9dsp>.

HAARP Thanks Hams for Help With Asteroid-Bounce Experiment

The University of Alaska Fairbanks's High-Frequency Active Auroral Research Program (HAARP) has thanked amateur radio operators and amateur astronomers for help with its asteroid-bounce experiment in late December. Signals were sent up to an asteroid passing near Earth's orbit.

Over 300 reception reports were submitted to HAARP researchers, according to the ARRL. The goal was not two-way contacts as hams make off the Moon or streaking meteors, but rather efforts to study near-Earth objects and defend our planet from large asteroids with the potential to cause significant damage.

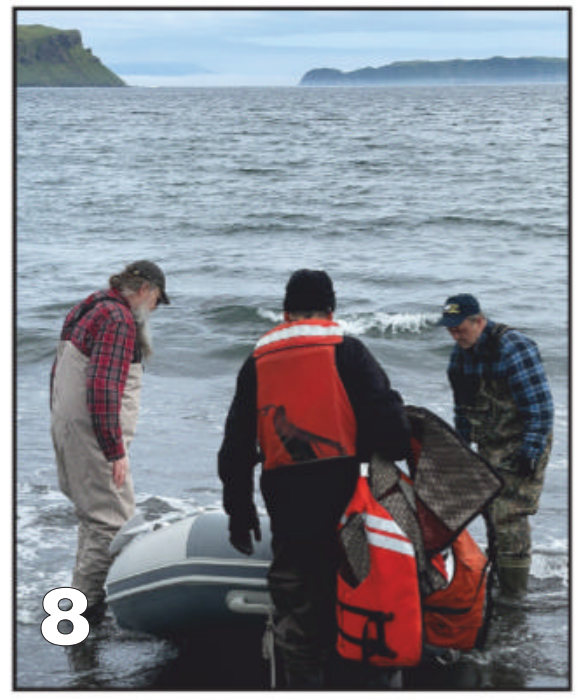
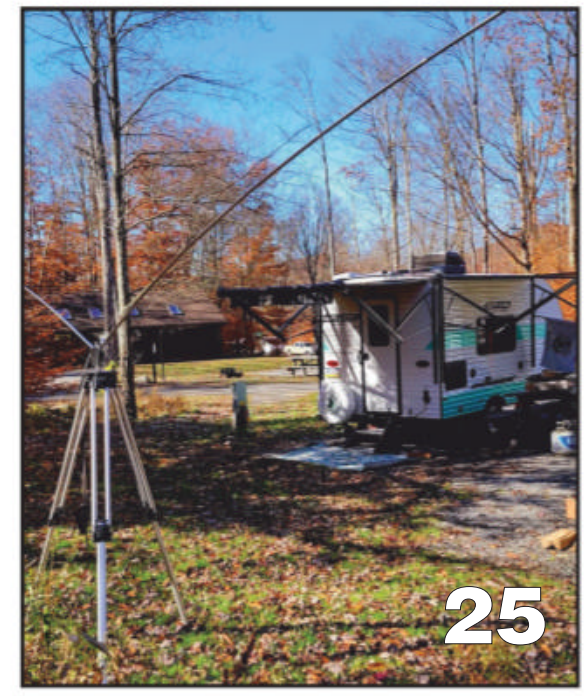
ON THE COVER

Getting a beam's-eye view! Herb Krumich, K2LNS, of Bear Creek, Pennsylvania, snapped this photo from the 60-foot level of his tower as he lowered his 4-element 20-meter beam on a tram line. Details on page 78. (Cover photo by Herb Krumich, K2LNS)





features

FOCUS ON: Spring is almost here, so it's time to start planning outdoor ham activities, from taking your scanner on the road (p. 22) to local POTA expeditions (p. 25) or the ends of the Earth (p. 8). Still outdoors, we've got more antennas for you (pgs. 33, 38 and 59), plus CQWW RTTY DX Contest results (p. 14) and trips from one end of the ham spectrum to the other (MF/LF column on p. 63, Learning Curve on p. 74 and VHF/UHF on p. 80). Have fun on the air, wherever you are!

zero bias: a cq editorial

BY RICH MOSESON,* W2VU

Beyond the Radio

Recently, I had an experience that reminded me of a "hidden" benefit of ham radio that goes beyond the radio. I was in Florida with my wife and son (who's also a ham) to celebrate my mom's 100th (!) birthday. We didn't have time to do any ham radio stuff but we were able to do some bird- and butterfly-watching at a couple of the state's many nature preserves. My son, among other things, is an excellent wildlife photographer and has a lens on his camera that extends halfway to the moon. While walking through one of the preserves just before sunset, we encountered another photographer with his camera on a tripod and a lens that extended well beyond the moon!

We made our way over to find out what he was looking for and arrived in time to hear him saying something to another visitor about "the antennas on my truck." The other gentleman said he had seen them and asked, "Are you an amateur radio operator?" "Yes," the man with the big lens replied, "I'm (callsign)." "I'm a ham, too," said the second person, and introduced himself as well. After giving them a couple of minutes to tell each other about their ham radio interests, Dan and I decided to join the QSO. "We couldn't help overhearing you talking about amateur radio. We're both hams, too," and introduced ourselves. We all spent the next half hour (as it got progressively darker) talking about ham radio, nature photography, and why the man with the big lens had driven an hour and a half to this particular spot (he was looking for a bobcat mom and her cubs who had been sighted there recently). It turns out that when he isn't looking for bobcats, he's a professor at Florida International University and the faculty sponsor for the National Hurricane Center Amateur Radio Club, WX4HNC (The National Hurricane Center and its ham station are located on the FIU campus, and all clubs need a faculty sponsor). You never know who you're going to meet through ham radio.

Oh, and at my mom's birthday party, while most of the guests were her friends or neighbors, the list also included a ham friend of mine who I first met at age 15 in our high school radio club. We've stayed in touch ever since and make a point of getting together whenever I'm down there visiting my mom.

My main point here is that not all memorable ham radio contacts depend on the ionosphere or repeaters, or even radios. Ham radio brings together people of diverse backgrounds and interests, and even overlapping interests (such as birding and wildlife photography) who might not otherwise meet or get to know each other. And some of the friendships that originate in a ham club or on the air can last a lifetime. It is one of the lesser-appreciated benefits to our hobby. We talk a lot about ham radio's value in emergency communications, in promoting and supporting STEM (science, technology, engineering and math) careers, and in providing a "sandbox" for experimenting in electronics and RF engineering. But we don't talk as much about the person-to-person aspect of amateur radio and the bridges it creates that can take people from being strangers to immediate friends.

My main point here is that not all memorable ham radio contacts depend on the ionosphere or repeaters, or even radios. Ham radio brings together people of diverse backgrounds and interests, and even overlapping interests...who might not otherwise meet or get to know each other.

To me, one of the most interesting parts about the QSO described above is that such contacts are not at all uncommon among hams. As we were leaving the nature preserve (in the dark), my son said to me, "What are the chances of two hams randomly encountering two other hams in a place that has no connection to ham radio?" My response was, "Excellent. It's happened too many times to count." Over the years, I have gotten involved with many, many, interesting people and activities simply by virtue of being a ham, even if there was no radio in sight! These contacts can help with off-air networking as well. I know lots of people (myself included) who have advanced their careers through the contacts they've made in ham radio, both on and off the air.

So yes, let's promote amateur radio's value for advancing technology, providing emergency communications, and promoting international goodwill through the contacts we make on the air, but let's not forget the value of the contacts we make off the air as well. (And Happy Birthday again, Mom! I know you're reading this!)

In This Issue

This month's *CQ* offers an eclectic mix of articles that showcase the breadth of our hobby while, at the same time, sticking close to our core interests of DX, contests, Morse code, and antennas. We start off with a DXpedition to Kiska Island in Alaska's Aleutians, halfway across the Pacific Ocean and part of the dividing line between the Pacific and the Bering Sea. As you'll read in the article, Kiska was one of two Aleutian islands occupied by Japan in World War II.

We've also got the results of the 2022 CQ World Wide RTTY DX Contest and a guide to ensuring you've got the right contest exchange copied; two antenna articles and a look at two antenna tuners; an introduction to Morse code "Instant Character Recognition" (ICR), and much more.

March heralds the arrival of equinoctial propagation on the HF bands, and VHF Editor N4DTF reminds us that it won't be long before sporadic-E season begins on 6 meters … and with a quickly rising sunspot cycle, there's no telling what magic the Magic Band may have in store for us this year. Enjoy the approach of spring warmth, and don't forget the CQWW WPX SSB Contest at the end of this month!

– 73, Rich, W2VU

Host Sought for 2026 WRTC

The World Radiosport Team Championship Sanctioning Committee is seeking proposals for hosting the 2026 World Radiosport Team Championship (WRTC) event.

The WRTC is an on-site amateur radio competition, usually held every four years. Previous WRTCs — dating back to 1990 — have been held in the U.S. (three times), Slovenia, Finland, Brazil, Russia, and Germany. WRTC2022, delayed due to the COVID-19 pandemic, is scheduled to be held this summer in Bologna, Italy.

Teams of two operators representing a geographical region of the world come to the host site to compete using similar antennas and locations, overseen by on-site referees. According to the sanctioning committee, the WRTC competition has typically been held as a contest-within-a-contest coincident with the IARU World HF Championship to capitalize on the high activity of a popular worldwide operating event.

Groups interested in hosting WRTC2026 should submit a Letter of Intent, with a summary proposal. This should include the following items:

~ Committee organization, identifying each of the principals involved and any relevant organizational and amateur radio experience especially in contesting / radiosport.

~ Competition description, including planned number of teams, geographic location of operating sites, and competitor selection process.

~ Social aspects, including approximate schedule, travel, and housing arrangements for participants.

~ Financing, including an outline of the budget and fundraising approach. A detailed budget is not required at this time.

~ Expected assistance and involvement from local and regional amateur radio organizations and regulatory authorities.

~ Public exposure, including plans to publicize and promote the event locally and worldwide.

March 31 Deadline

Letters of Intent must be submitted no later than March 31, 2023 at 2359 UTC. The WRTC Sanctioning Committee will review all proposals received and will respond by April 30, 2023. Additional information may be requested.

It is the goal of the WRTC-SC to announce the venue for the WRTC2026 at the close of WRTC2022 in Bologna in July 2023. Letters of Intent should be submitted directly to the chairman of the WRTC Sanctioning Committee, Tine Brajnik, S50A, via email to <tine.brajnik@gmail.com>.

More information about WRTC is available at <https://wrtc.info>; specific info about this summer's competition may be found at <http://wrtc2022.it>.

BY BOB SCHENCK,* N2OO

K7K: DXpedition from the Edge of Alaska

BY ADRIAN CIUPERCA,# KO8SCA, WITH YURI SUSHKIN, N3QQ, AND HAL TURLEY, W8HC

This month, I have turned over the keyboard to Adrian, KO8SCA, with assists from Yuri, N3QQ, and Hal, W8HC, to tell the story of their recent DXpedition to Kiska Island, K7K. Their adventure was a special one, visiting a place that is extremely remote in the Aleutian Islands of Alaska. I hope that you will enjoy their story! – Bob, N2OO

"Trust your heart if the seas catch fire, live by love though the stars walk backward." – e.e. cummings

At the far western edge of the State of Alaska lies a group of islands, spread like a string of pearls spanning a distance greater than 1,000 miles. These are the Aleutian Islands.

* Email: <n2oo@comcast.net>
# Email: <ciup@yahoo.com>

For a few days during July 2022, a team of six operators sailed out into the Aleutians in what was a third DXpedition attempt to activate the rare IOTA group (IOTA NA-070, POTA K-0143) called Kiska Island, a desolate and inhospitable place within the Alaska Maritime National Wildlife Refuge.

The Aleutians

Alaska is such a large state and it is hard to comprehend some distances unless one uses geographic comparisons. So here is one: The distance from Alaska's eastern to western border is greater than the distance between New York and San Francisco. In fact, Kiska Island is closer to Tokyo than it is to San Francisco.

The Aleutian Islands consist of 72 islands born out of the volcanic eruptions 55 million years ago. They are located at the juncture of the northern edge of the warm waters of the Pacific Ocean and the southern reaches of the extremely cold and hostile waters of the Bering Sea, creating some of

A view of Kiska Island (All photos courtesy of the K7K team)

the most violent weather conditions in the Northern Hemisphere. Most of the far western Aleutian Islands, including Kiska, are uninhabited.

Kiska Island

The island is only 5 miles wide and 22 miles long. It is desolate and uninhabited, covered by volcanic sand and tall grass. There are no trees or animals except some rats that are said to have roamed the island since the first explorers brought them there on their sailing boats. At the far end of the island, there is a 4,000-foot-tall active volcano. The weather is harsh, with only eight clear days a year amidst an average of 250 days of rain, powerful winds, and 100 days of bitter cold darkness. That pretty much describes a place that probably should be avoided by humans.

Kiska's Role in WWII

Visiting Kiska Island requires close coordination with the U.S. Fish and Wildlife Service (FWS). If you plan an IOTA expedition to Alaska, you will need to contact U.S. FWS in Homer first and begin the coordination process. Many of Alaska's islands are managed by U.S. FWS and access to some have unique requirements. Access to Kiska is closed for general population visits. One of the reasons for such difficulty is because some of these islands, including Kiska, are littered with unexploded ordnance (UXO) ... remnants of World War II. The year 2022 marked 80 years from the start of the Aleutian campaign of WWII, also known as the "1,000-mile war," an event in history which was also commemorated by our K7K DXpedition.

During WWII, Japanese forces were eyeing the capture and occupation of Midway Island, a tiny speck of land and a U.S. possession in the Pacific. Midway served as an important refueling stop for the U.S. bombers intending to reach Japan. Militarily, Japanese forces needed a ruse in order to draw the U.S. Pacific Fleet away from Midway. The Aleutians Islands fit perfectly into that strategic scenario.

Luckily however, U.S. intelligence services had broken the Japanese naval codes. The Japanese plans were revealed and now known to the U.S. forces. Nevertheless, this remote region became a fiercely contested battleground with Japanese forces capturing two of the islands in the Aleutian archipelago — Attu and Kiska.

Some 6,800 Japanese soldiers occupied Kiska Island for nearly two years, and to survive they built multiple structures, resembling a small town … living quarters, underground tunnels, water towers, telegraph poles, unpaved roads, a submarine base, and multiple military installations. Some of these structures are still standing today.

In the end, the fiercest enemy of both the Japanese and Allied combatants fighting in the 1,000-mile-long Aleutian campaign was the weather. Following the Japanese loss and 2,300 casualties suffered during an intense 19-day battle at Attu that ended July 28, 1943, Allied forces shifted their attention to

Our boat, the April Lane, docked in Adak, Alaska.

Boat captain Rick

One of the World War II antiaircraft guns still in place on Kiska Island, along with unexploded ordnance that makes it mandatory to get special permission to land there.

Landing and departing the island were the most difficult moments of the DXpedition.

retaking Kiska. Fearing similar defeat, the Japanese commander at Kiska realized he was in a no-win position and took advantage of the weather. With dense fog and harsh winds blowing sideways, 5,000 Japanese troops boarded vessels and left Kiska Island undetected by Allied command. On August 15th, Allied U.S. and Canadian forces invaded the island still not aware that the enemy had left. Attacking from two sides of the island in dense fog, there were many servicemen killed or wounded by "friendly fire." All of the Aleutian Islands were now back in the hands of the U.S. Command.

IOTA

The Islands on the Air (IOTA) program was established in 1967 and aims to recognize and certify ham operators for contacting islands around the world. For IOTA purposes, open sea islands of the world are grouped in 1,200 references.

The starting point in the program is having confirmed the first 100 references and being awarded the IOTA 100 certificate. Improving the score is a steady pursuit, and can take many years of effort, making IOTA both challenging and rewarding.

Many of the world's islands are uninhabited and very remote, often requiring special permission to land on and operate from. These are all reasons why some IOTA references are rarely activated, and some perhaps for only a few days every five, 10, or even 20 years or so. More details about the IOTA program are available at <www.iota-world.org>.

Kiska Island — Third Time is the Charm

The 2022 K7K IOTA expedition was actually attempt number three to reach Kiska Island. In 2020, the pandemic curtailed our travel plans and forced the cancellation of the KL7RRC expedition after equipment and supplies had already been staged in Dutch Harbor, Alaska.

In 2021, one of the crew members of our chartered, prepaid vessel suffered a medical emergency prior to picking up our eight totes of gear at Dutch. The original plan called for team member Tim, NL8F, to help load the gear onto the boat and sail out to Adak Island (NA-039) where he would meet up with the other five members who would be flying into Adak from Anchorage. Tim was able to locate a vessel to take the totes to Adak and thought there was a good possibility we could locate another char-

Team members Alex, KL5CX; Adrian, KO8SCA; James, KB2FMH; Tim, NL8F; Yuri, N3QQ (team leader); and Hal, W8HC.

ter from there. Unfortunately, Murphy struck again and another vessel was not available ... BUT the KL7RRC team, consisting of Tim, NL8F; Walt, N6XG; Hal, W8HC; Rob, N7QT; and Yuri, N3QQ, made the most of their time as they operated for eight days from Adak Island. They logged over 10,300 QSOs with 102 different DXCC entities, many stations making their first-ever QSO with NA-039. During the operation, the group also experienced several great sporadic-E (E_S) openings on 6 meters with 820 QSOs in the log on the "magic band." Some of the members of the team left Adak Island hoping for another chance at elusive Kiska the following year.

In 2022, the K7K Kiska IOTA Expedition team was made up of six operators: Alex, KL5CX; Adrian, KO8SCA; Hal, W8HC; James, KB2FMH; Tim, NL8F; and Yuri, N3QQ. Yuri was the team leader and is a passionate and experienced DXpeditioner who has activated many rare IOTA entities. He has been the main organizer, proponent, and decision-maker in getting this tough project off the ground and his perseverance certainly paid off.

Tim, NL8F, a native Alaskan, was instrumental in finding the boat, the key to the success of our DXpedition. He is a mechanic by trade and owns a vessel repair business in Dutch Harbor. To say, "his mechanical repair skills came to

K7K tents and antennas

the rescue multiple times during our stay on Kiska," is an understatement!

Hal, W8HC, is a veteran DXpeditioner and INDEXA officer. His DXpedition experience is impressive, as he has been a member of many DXpeditions to top 20 entities. His experience was welcomed by our team and we all enjoyed listening to his stories from his past DXpeditions to some of the most remote places on Earth.

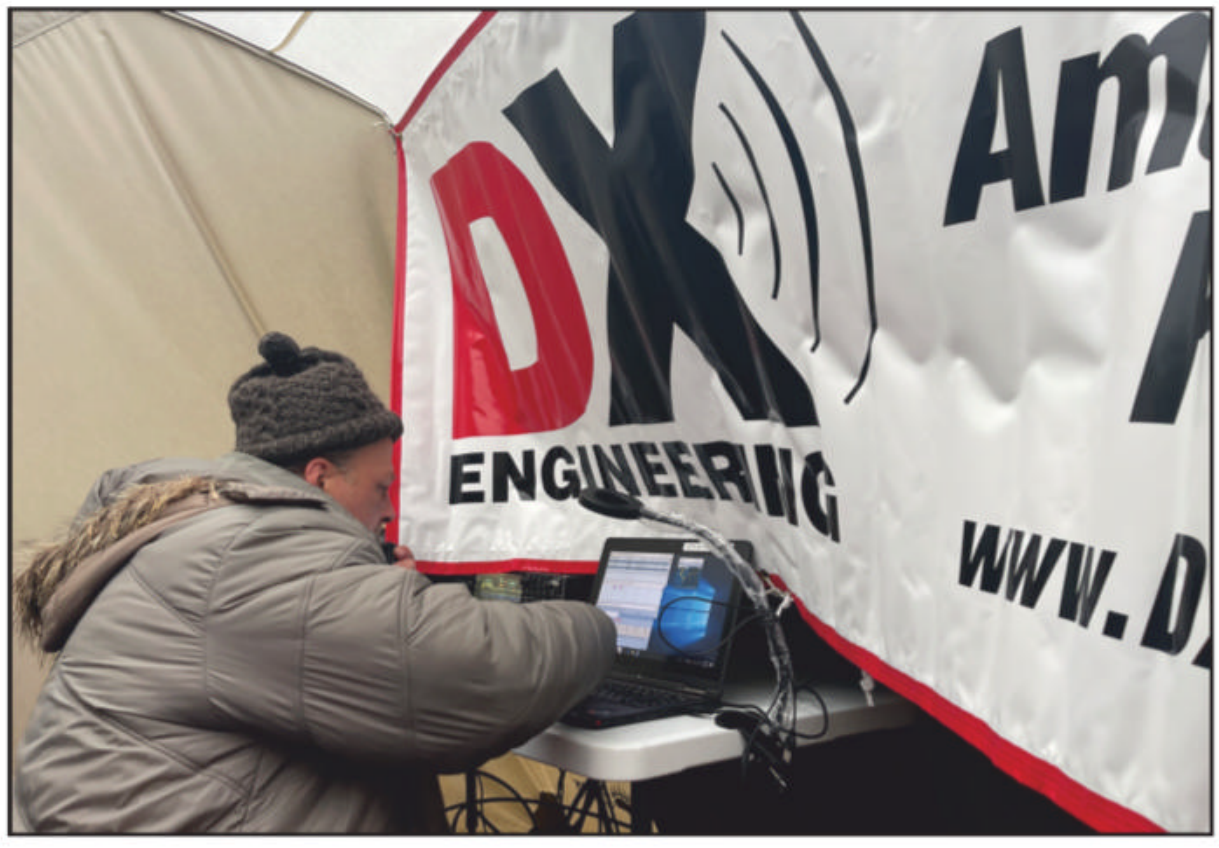
Alex, KL5CX (also born in Alaska), our youngest team member, works as a commercial pilot for one of the major airlines. His youthful energy was envied by the whole team. This was Alex's first DXpedition and others on the team are hopeful this will be the first of many in his future. Among other duties, he was assigned the difficult task of piloting the Zodiac inflatable landing boat during our excursions to and from the island. His skills were cheered by the entire team, especially when he was able to navigate the Zodiac in some very difficult conditions that we encountered.

James, KB2FMH, is a passionate POTA (Parks on the Air) activator and one can often hear him on the air from one of the myriad of parks around the New York area. This was James' first DXpedition and one could easily see his excitement along the way. He was the first one to ask, "Where do we go next?" even before the K7K DXpedition had concluded. He would describe himself as someone who likes to talk and so he became the voice behind most of our SSB QSOs.

Adrian, KO8SCA (your author), notes that "K7K was DXpedition #29 for me. I love traveling and blending that with ham radio is the perfect recipe for a great trip. K7K was no exception to this rule. Furthermore, the tough environment encountered on Kiska allowed me to test some of the gear that I plan to bring in my upcoming 3YØJ DXpedition to Bouvet Island in January 2023."

Bringing two DXpedition first-timers, Alex and James, as members of K7K was a refreshing idea and the team was really excited about that. It is probably one of the most successful ways to bring younger people into our hobby and into DXpeditioning in general.

Hal, W8HC, preparing a meal.



Yuri, N3QQ, operating CW.

Our Vessel and Able Captain

Our DXpedition had a budget of about $50,000, most of which was used to pay for the boat, its captain, and fuel. Our chartered boat for the July 2022 K7K trip to Kiska Island was the "April Lane," a 56-foot fishing boat based out of Dutch Harbor, Alaska. Navigating the treacherous waters of the Bering Sea requires an appropriate boat and the 88-ton April Lane did the job perfectly.

Alaska king crab fishing season normally opens in the fall and runs through the early winter months, usually between October and January. This timeframe allowed us to find and secure this particular fishing boat for our trip in the month of July. Having a suitable vessel is one thing, but having someone who knows what they are doing with it is another. Fortunately for us, we had Captain Rick Fehst. Captain Rick, a jovial and experienced sailor of the Aleutians, entertained us with lots of stories and was a great companion during our voyage. We learned that his skills as a seaman and unique personal charm actually enabled him to become somewhat of a TV celebrity. Rick was one of the featured captains in Season 5 of the very successful "Deadliest Catch," a reality television series that started in 2005 on the Discovery Channel and has enjoyed an

extended run on the television for 18 seasons. If you are not familiar with the show, it follows crab fishermen in the Bering Sea during the Alaskan king crab and snow crab fishing seasons. Crab fishing is listed by Occupational Safety and Health Administration (OSHA) as the deadliest job in Alaska and the show gives the viewer a glimpse of the tough conditions in the Bering Sea and the intense physical labor associated with this type of job. Needless to say, our team felt quite comfortable and safe knowing that we had such a nautical veteran of some of the most treacherous waters on earth.

Rick had told us on the voyage out that he was looking forward to the possibility of going onshore at Kiska when we were there. He was quite familiar with the island from his time fishing the Aleutians. Obviously, he could not take time away from fishing work to go ashore. But he was especially interested in seeing the rusting military remnants from WWII, the Japanese mini-subs rusting on the beach, the sunken ship in Kiska Harbor, and the anti-aircraft guns placed strategically around the island. Unfortunately, between the weather conditions and our operating schedule, we were unable to send someone over to the April Lane anchored in the harbor and relieve Rick so he could make the 300-meter Zodiac trip to the island. Captain Rick will have to put this on his bucket list if he ever wants to go out into the Aleutian extremes in order to set foot on Kiska.

Preparing for Departure

All of the totes of gear that had been shipped to Adak in 2021 had been returned to Dutch Harbor through Tim's Alaskan shipping connections. Tim also provided warehouse space in his business to store all of the gear. The plan was basically the same as 2021 with Tim loading the vessel and traveling onboard the April Lane from Dutch to Adak where the other members of the team would be flying in to meet him. Tim asked if anyone from the team could possibly come to Dutch early and join him in all the preparations, ensuring everything was accounted for, in proper working order, and then help him load everything onto the boat. Hal volunteered to go up early to assist Tim had arranged his travel plans making the long flight to Dutch Harbor from Charleston, West Virginia and arriving on July 17th. Tim and Hal had three days to ensure everything was accounted for, functional, and ready to be loaded onto the boat. There were generators, tents,

James, KB2FMH, operating SSB.

tables, chairs, fuel, water (there is no drinkable water on Kiska), food, antennas, coax, cots, etc. Keep in mind that the six members of our team would be living on an uninhabited island for a week. We would be building a "city" on Kiska and we definitely did not want to forget anything! The nearest Wal-Mart was almost 1,400 miles away.

Time to Set Sail

Captain Rick and his two-member crew of Tim and Hal finished loading the boat in Dutch on July 21st with the first order of business to position the vessel at the fueling dock where Rick topped off the fuel tanks. By early afternoon, they were on their way to Adak Island, a three-day westward sail where they would pick up four additional members of the DXpedition team: Yuri, Alex, James, and Adrian. These additional four members were able to fly directly into Adak. Even though Adak Island has a population of about 50 people, it has an airport with a large runway allowing large jetliners to land on the island. Adak Island used to house a significant US military installation until about 20 years ago and that's the reason behind the existence of the large runway. Today, it is mostly a "ghost town" with abandoned buildings, many in states of disrepair due to the violent weather there. As you arrive at the airport and depart, you are greeted by a sign on the terminal, "Welcome to Adak, birthplace of Winds," a fitting tribute to a location that will regularly experience 120 mile-per-hour wind squalls!

The April Lane arrived late at night and as soon as we were boarded, each with our own gear and equipment, we were under way. Our voyage from Adak to Kiska was about 36 hours long and the six DXpedition members spent time discussing operating details and activating rare grids maritime mobile on 6 meters.

In retrospect, we all agreed that the boat and its captain were the key to our successful DXpedition.

The Equipment

We had five antennas installed right on the beach. That, of course, is the biggest advantage of operating from an island. And using mainly vertical antennas, light and easy to assemble, allowed us to hear signals from all directions and to repair them quickly. The 17-meter VDA provided by Walt, N6XG, was our workhorse, a simple antenna that really does wonders and which put a significant number of the QSOs in the log. The CrankIR that Tim took down and brought from his QTH proved to be extremely convenient as it allowed us to easily operate in multiple bands with its simple and reliable mechanics.

Of course, the weather was a factor in choosing our antennas. As expected, heavy winds forced us to make daily equipment repairs. We had cold, wind, and rain all the time and at the same time, except for one sunny day when we took pictures and explored the island.

(Continued on page 84)

Results of the 2022 CQWW RTTY DX Contest

BY CHRIS TATE,* N6WM

Recovering from pandemic travel restrictions, the emergence of solar cycle 25, and return of DX on the 10-meter band, along with additional improvements in propagation, helped ring in the 36th annual running of the CQ Worldwide RTTY DX contest.

Overall reports were of good conditions from most points around the world, with the exception of some stations in Asia that were affected by inclement weather. Participation was relatively unaffected by the easing of the pandemic; in fact, peak log submission was in 2020 at over 3,600 logs, but we were down a few hundred logs from last year at 3,190 logs. Many of the regular top players were back at their DX QTHs. Despite improved conditions, no records of note were broken in 2022, but the new Explorer category set some new baselines.

Above and beyond printing certificates and checking contest dates, the CQWW RTTY website is very comprehensive and full of interesting data and specifics. Check it out at <http://cqwwrtty.com> and look at results, records, resources, and more!

Let's take a deeper dive into the contest itself and see how it went!

Single-Op Categories

Single-Operator High Power (SOHP) All Band

Ed, P49X (op. WØYK), was back in Aruba after an extended pandemic QRX. He regained his SOHP world title. Ed bested LZ5R by over a million (mega) points to solidly maintain the top position. The top U.S. position was achieved by Randy, K5ZD, with a very respectable score of about 4.2 megapoints. There are serious competitors in all categories, but this one is of note, good performances from well-known contest stations like W7RN (op. WK6I) out west, and JH4UYB are a couple of stations that found themselves in the world top 10.

Single-Operator High Power All Band Assisted

The assisted category had a slightly different demographic, with the win going to Cyprus station P3X (op. 5B4AMM). In the U.S., Bud, AA3B, a powerhouse in contesting on all modes, was able to take the honors by besting challenger K1LZ (op. LU9ESD) by about half a megapoint.

Single-Operator Low Power All Band

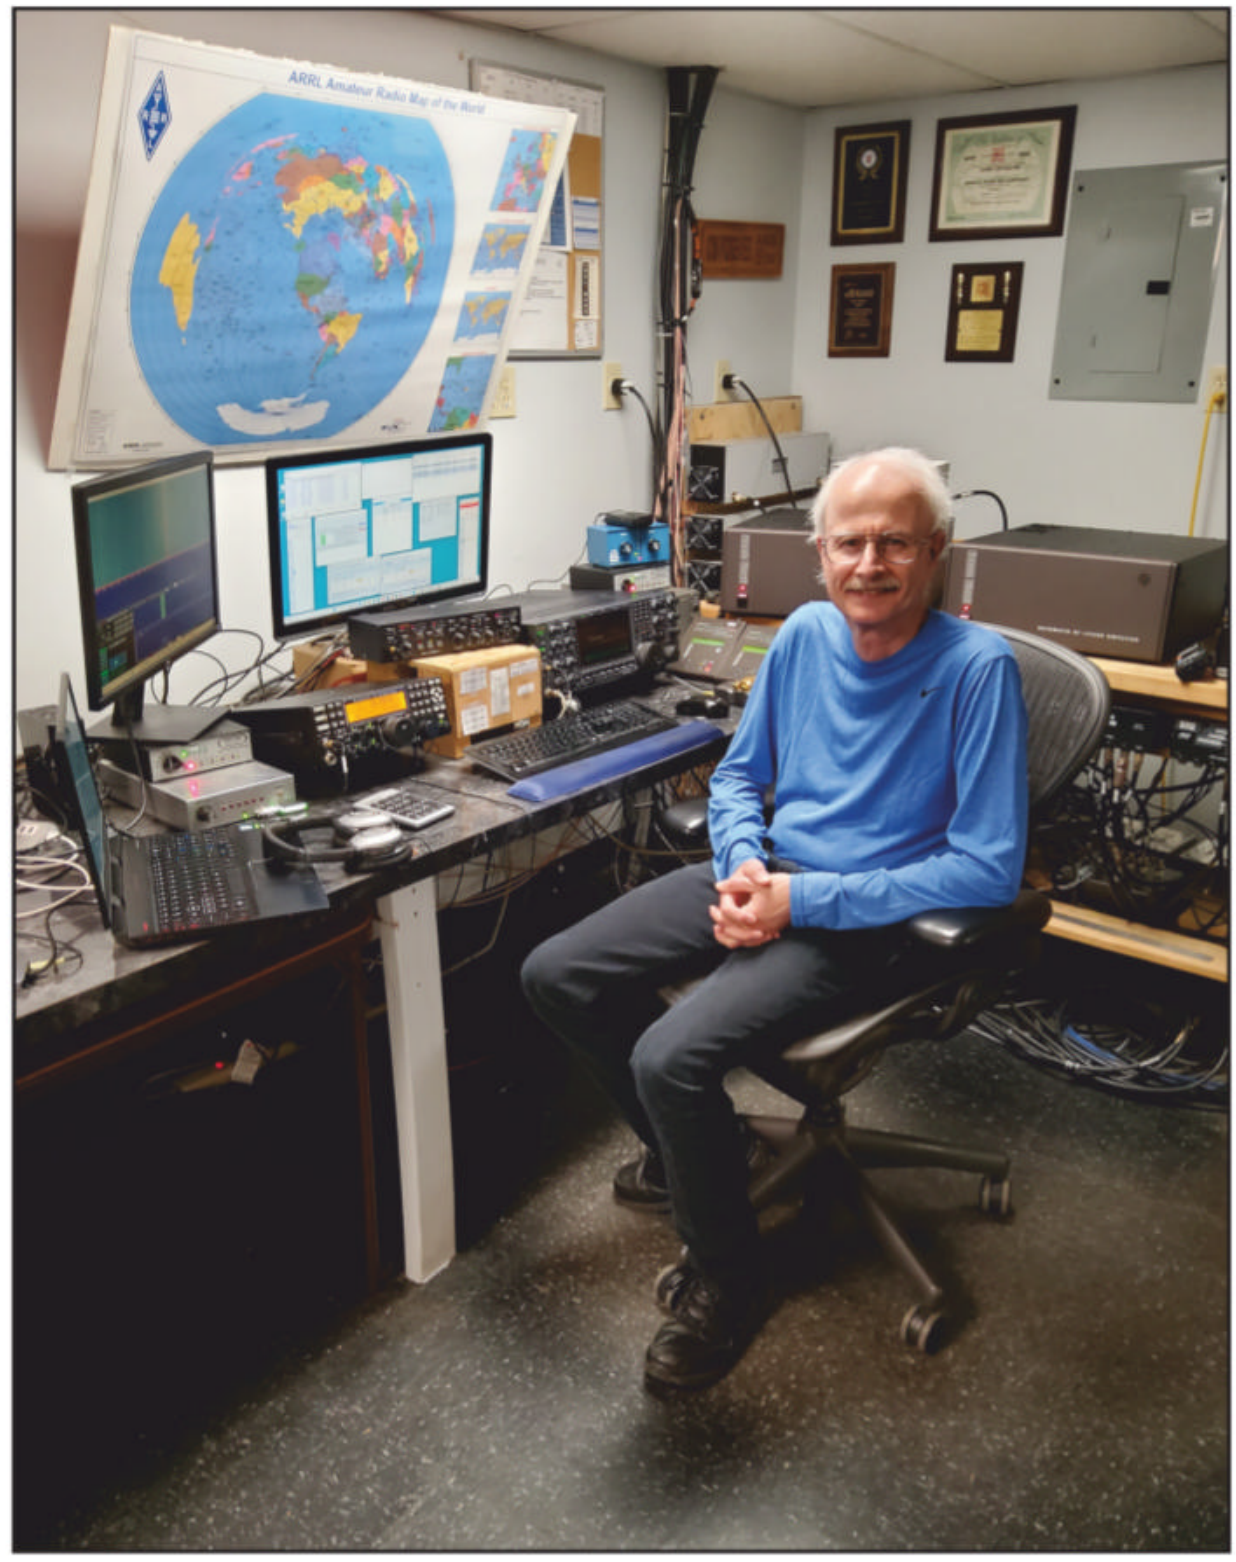
Yuri, VE3DZ, managed to edge out CX2DK by a half megapoint. ZF2WB (op. Mariano, LU8EOT) managed to best CR5O (op. CT7AGL)

Single-Operator Low Power Assisted All Band

TM3Z (op. F4DSK) managed to solidly win the top spot in Low Power by besting SV2AEL and JA6CGE, respectively. Don, AA5AU, took top honors in the U.S. with KI1G hot on his heels. That was a close one.

Single-Operator QRP All Band

It takes a special kind of patience to do a worldwide contest using QRP, but



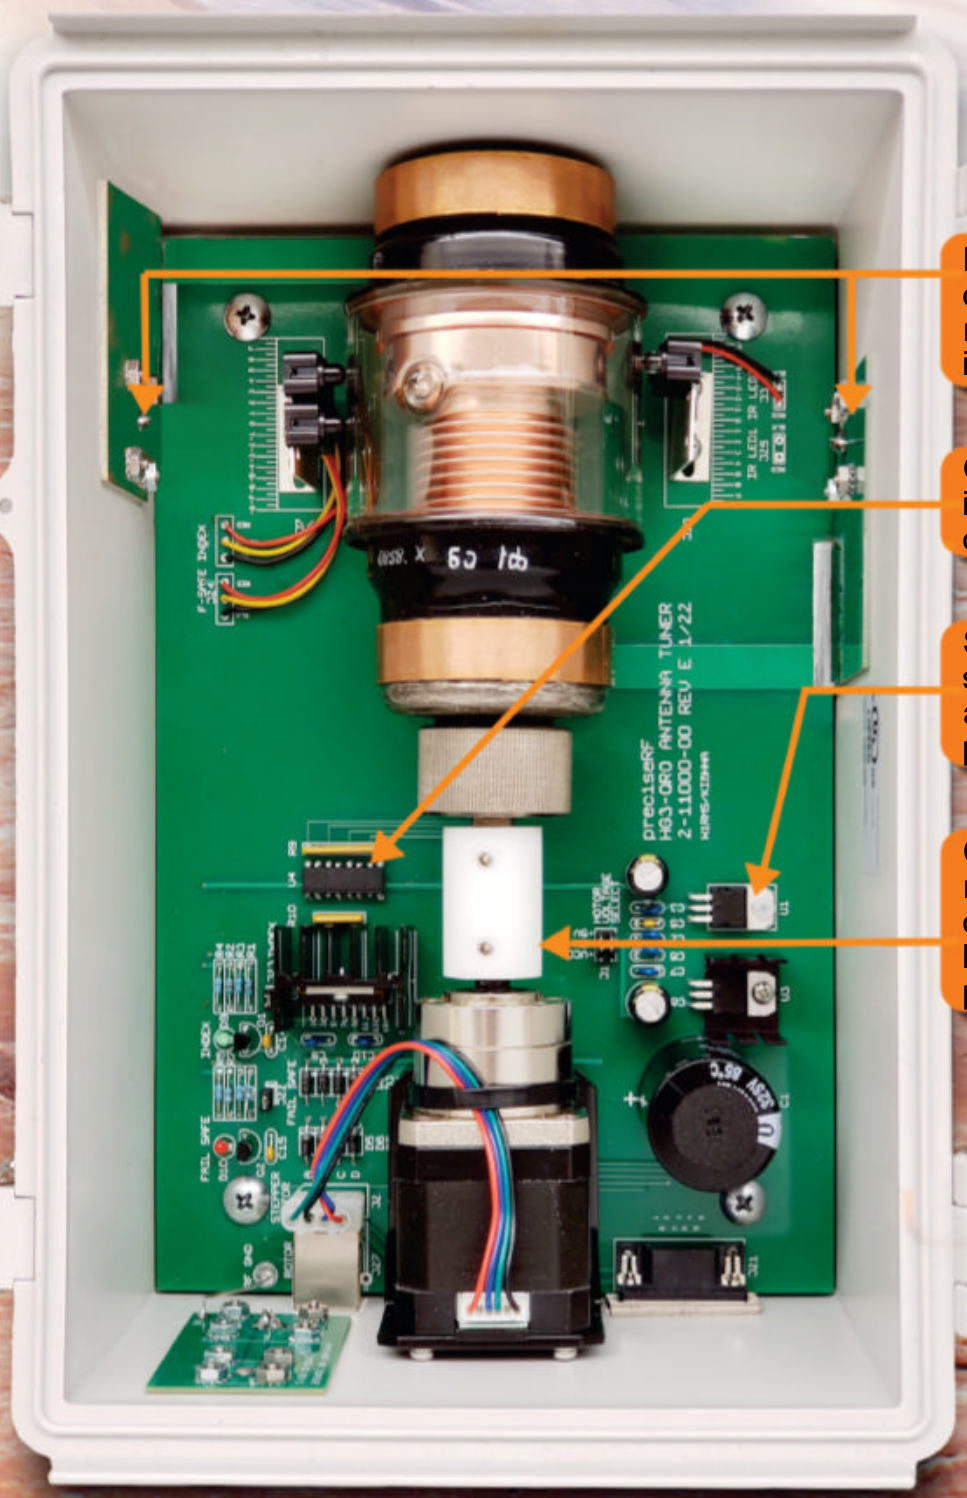
Bud, AA3B, pauses from contesting to smile for the camera. (Courtesy of AA3B)

Email: <n6wm@largeradio.org>

COMPROMISE WAS NOT AN OPTION FOR THE NEW HG3 QRO-A!

No Compromises Mag Loop
The new HG3 QRO-A raised the bar again for Magnetic Loop Antennas (MLA). MLAs are well known for their superior performance. The remotely tuned HG3 QRO-A MLA covers 80*-10 meters with stepper motor precision and resolution. The high Q vacuum capacitor allows for 1.5 KW PEP*. The 45,000-step resolution delivers an unprecedented 511 Hz resolution bandwidth allowing you to set your band preferences spot on. Rapid-Tune automatically scans each band for the lowest SWR and works with most HF radios.

It Pays to Pay Attention
How do you make a great product even better? You listen to your customers.The heart of an MLA is the tuner. We made so many improvements to it that we now call it the HG3 QRO-A. The HG3 Plus Controller also received new firmware and an improved SWR function. *Some limitations may apply or are optional.



HG3 QRO-A Improvements:

- Integrated capacitor to radiator connections with six times more copper surface area for improved efficiency
- Optical isolated driver interface allows for a longer control cable and RFI rejection
- Separate logic circuit and stepper motor power supplies allow for smoother and more precise tuning
- Custom high voltage Delrin motor to capacitor shaft coupler provides for greater high power and high voltage protection

Dave, K2YG, persevered and took the world QRP title. His 375,000-point QRP effort was enough to beat the others in the top five that were all European stations. Congratulations, Dave!

Single-Operator QRP Assisted All Band

ON6NL turned in an impressive half-million-point score in the assisted QRP category, easily besting DL6ZBM and others. K2AL had the high score in the U.S.

Single-Operator Single-Band Categories

One of the great things about this worldwide RTTY DX contest is the plethora of categories that can be entered. The single-band categories give opportunities for titles that may be out of reach to some locations, or for some participants that are crunched for time. They are available in all three power levels as well as assisted or not. Sometimes there are some fierce battles with these and I encourage all readers to dive into the line scores and check them out.

Multi-Op Categories

Multi-Operator Single Transmitter High Power

The team at IQ4FC managed to narrowly beat an equally great effort by the Moravian Contest Group, OK5Z, in this very popular category. Competition is generally quite fierce and this battle did not disappoint.

Multi-Operator Single Transmitter Low Power

In an interesting turn of events, the KP2B team took top honors. They were originally slated to operate at WP3C but that operation was scuttled due to the effects of Hurricane Fiona. Jim, WP3A, loaned the team his KP2B station and relocated the operation to the U.S. Virgin Islands. Apparently, this worked out well as they enjoy being in the winners' circle with a solid megapoint-lead over the second-place team at EA8DED.

Multi-Operator Two Transmitter

The team at CR3DX solidly took this category with nearly double the score of the top U.S. team at K9CT, which managed to take first place in the U.S. and second place in the world. Of note is the up-and-coming NJ4P contest team run by WV4P, which settled into second place in the U.S., and fourth place overall. This new contest powerhouse station is really starting to make a dent out there. A great job by all.

Multi-Operator Multi-Transmitter

I have a sweet spot for the fun and camaraderie of Multi-

Multi contesting. The Multi-op crew at the Santana RRDXA Contest Team, CR3W, took top honors this year by besting a large team at K1SFA, who activated the K1TTT superstation for the event. Your author was a member of the N6WM team in W6, activating the N6RO superstation. Worldwide contesting from the U.S. West Coast is always a challenge, and the team did a good job settling into second place in the U.S.

Overlay Categories That Keep Things Interesting

These overlays give more opportunities for participants to compete. The overlay categories are comprised of Classic, Rookie, Youth, and Explorer, and are further subdivided into high- and low-power options. More information on these overlays can be found in the contest rules, as well as the <cqwwrtty.com> website.

Classic mode, in which operators are limited to a single radio and operate 24 hours, is becoming a very popular and competitive entry option.

Classic

Vladmir, RW1A, took the high-power top spot worldwide, but it was a close race with Serbian operator Brane,

YT3D.* Alex, KU1CW, was hot on the tail of YT3D claiming the first-place spot in the U.S. Dirk, ON4CT, takes top low-power honors in a very tight race with the HH2AA remote station operated by Alan, K6DTT.

Rookie

A big high-power score out of Irish rookie Rafal, EI6LA, who had been licensed just shy of a year before the contest, was enough to win this overlay. In North America, basically a four-way race was won by Erik, KD2UBH, in New York, who returned to ham radio in 2020. In the low-power arena, Steve, K3AK, managed to best second place Sebastian, KI2D, by almost double the score. Great job to all the Rookies and welcome to CQWW RTTY contesting.

Youth

It's fantastic that we offer a category for younger operators to enjoy some competitive radiosport. There was a solid battle for first place, which was won by Ivan, 9A2ZI. But Robert, DM7XX, did a great job keeping pace and put up a good fight and secured second place in an exciting race.

Explorer Category

The new Explorer category had a couple of entries. This category recognizes innovation in station design, operating strategies, and technology and was put in place to allow experimentation in a contest environment. The most common application has been a distributed multi-op in which several contesters get together from their home stations to produce a multi-op effort.

The three-person team at VE2CQ was able to do this very effectively and produce a respectable score of over a mega-

*(*YT3D is the winner of this category, in accordance with CQ policy following Russia's invasion of Ukraine,)*

point. We would love to hear more from operators producing efforts in the category. It keeps things fresh and interesting. The full explorer rules can be found at the main CQWW contest website <https://cqww.com/explorer.htm>.

Plaque Sponsorship

Plaque sponsorship is a great way to recognize local or zone competitions and efforts. Rich, N1IXF, can be very helpful in assisting your selection of a plaque to sponsor. The entire CQWW RTTY management team appreciates these invaluable sponsorship opportunities. Look at the plaque winners tables, and if there is a category or region you would like to sponsor, let us know or contact N1IXF directly <n1ixf@att.net>.

In Closing

On behalf of the CQWW RTTY contesting team, we would like to congratulate all winners and participants. With band conditions improving rapidly, and pandemic restrictions waning, the next running in September 2023 should prove another fun and interesting event for all.

73 and looking forward to working you in the next one.

– Chris, N6WM; Ed, WØYK; & Rich, N1IXF

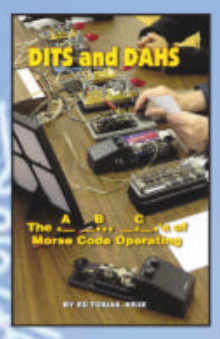
Winter Specials for the Hams in Your Life...

DITS and DAHS

The .- A -... B -.-. C 's of Morse Code Operating

by Ed Tobias, KR3E



This small by solid guide is the perfect read for those interested in learning or improving CQ operating techniques!

Within its pages you'll find

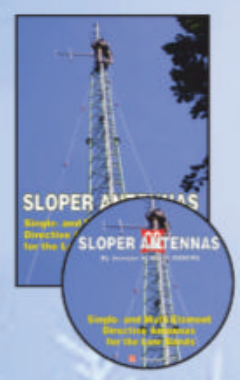
- The secret of becoming a proficient CQ Operator
- Where and how to practice, practice, practice.
- Straight Key or Paddle?
- Adjusting your Straight Key or Paddle
- Keyers, Iambic Keying and Bugs
- Contests & Events, DXing
- Operating QSK
- CW Filters

and much, much more!

6 x 9 Paperback $15.95

Sloper Antennas

by Juergen A. Weigl, OE5CWL



Single- and Multi-Element Directive Antennas for the Low Bands

With calculations and practical experience, this book shows which basic concepts have to be considered for sloper antennas for the low bands.

6 X 9 Paperback $25.95
CD Version $19.95

Buy both for only $38.95

W6SAI HF Antenna Handbook

by Bill Orr, W6SAI

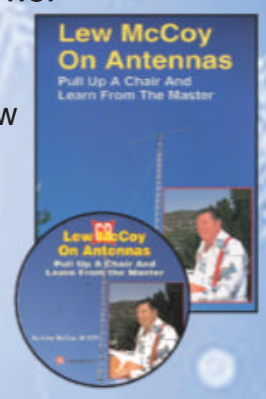
W6SAI was known for his easy-to-understand writing style. In keeping with this tradition, this book is a thoroughly readable text for any antenna enthusiast, jam-packed with dozens of inexpensive, practical antenna projects that work!

8.5 X 11 Paperback $21.95
CD Version $15.95

Buy both for only $32.95

Lew McCoy on Antennas

by Lew McCoy, W1ICP



Unlike many technical publications, Lew presents his invaluable antenna info in a casual, non-intimidating way for anyone!

8.5 X 11 Paperback $19.95
CD Version $14.95

Buy both for only $29.95

33 Simple Weekend Projects

by Dave Ingram, K4TWJ

Do-it-yourself electronics projects from the most basic to the fairly sophisticated. Also, practical tips and techniques on creating your own projects.

6 X 9 Paperback $17.95

The Quad Antenna

by Bob Haviland, W4MB

Comprehensive guide to the construction, design and performance of Quad Antennas. General Concepts, Circular-Loop & Arrays, Rectangular & Square Loops, Multi-Element Quads and more!

WB9YBM concludes his three-part series on getting the most out of your scanner and/or scanning VHF/UHF ham rig. This segment focuses on taking your radio along on your travels.

Going Portable with Scanners and Ham Radio Handhelds

BY KLAUS SPIES,* WB9YBM

If going portable near home with either your scanner or ham handie-talkie (HT), it's as easy as clipping the radio and maybe a spare battery to your belt and that's it. If you realize later that you need a battery charger or other accessory, you're close enough to home to conveniently take care of whatever you missed the first time you walked out the door.

It's not so easy when you're going a bit farther from home — like a day's outing, Field Day, hamfest, or vacation — since we can't conveniently return home to grab what we forgot. How do we ensure we take along everything we need without missing anything?

The easiest thing to do is create a checklist — ensure it covers *every*thing you'll need. Relying only on one's memory is not always that reliable, especially when under the stress of planning and packing for a trip.

If you've got enough spare nooks and crannies available in your luggage, you might not need much more than a checklist. Just be aware that there are sensitive items like the keyboard on the front of the radio and inflexible gain antennas that will most likely require padding and should probably be packed between some soft items — between the shirts, for example.

Personally, I prefer having my radio equipment in its own carrying case. That way I don't need to rely on finding spare room in an uncertain source — plus this approach will make it easier to just grab and go when I'm not taking along luggage like during a day trip. There are a few options for this: Some of the places selling electronic components for the home hobbyist also sell generic carrying cases for test equipment. The hard foam inside of these carrying cases can be custom tailored by the user for any equipment they want to carry. These cases are pretty rugged,

Photo A. It's a good idea to lay out all of your gear on a table before buying a carrying bag (or case) to see how much space you'll need. This photo shows the author's portable scanner and accessories.

* Email: <wb9ybm1@yahoo.com>

look professional, and are customizable. If you think your handheld will be exposed to rough service like a DXpedition, this approach is worth considering, although due to the expense this option might be considered overkill for less severe use. For a gentler approach, my go-to method is to visit a photography supply store. It will have a variety of nice-looking carrying cases for cameras and camera equipment in multiple sizes, making it easy to select a carrying bag of the right capacity. These cases come complete with carrying handles, are made from several different materials including vinyl and fake or real leather, and have at least a modicum of built-in padding. The price range can vary quite a bit, depending upon size and quality. For average use, the cheap end of the spectrum will work although if you'd like something that lasts longer without showing wear and tear or you'd like to show off with something fancier, the higher end approach (possibly all leather) might be worth considering. Even the fancier photo bags come with a caveat: If it looks too fancy and is left in plain sight, it might be seen as tempting by would-be thieves.

Before buying a carrying case, I'd suggest laying out everything you need to take along on the kitchen table to get an idea of how big of a case you need (*Photos A* and *B*). It's better to go slightly larger than needed instead of getting the bare minimum. This will allow for additional padding to be inserted (should you think it necessary), and of course inevitably there will always be a few items that get added as an afterthought (like a spare note pad or pen). This will also allow for certain safety: Batteries need to be stored in a way that, should they shift during transport, metal objects (like a gain antenna) will not cause a short of the terminals. A spare pocket in the case dedicated to batteries would be the safest option instead of storing these in the main compartment (I've also clipped them to the carrying handle, although there they need watching so they don't accidentally get knocked off).

While a scanner will stand reasonably well on its own, this is not the case with a ham HT when it's used with a speaker-microphone. While using a speaker-mic is not mandatory, I like to use one especially during longer contacts as the HT will get warm. First of all, this will allow better air circulation around the radio, and secondly, I'm not adding body heat to a radio that's already generating its own heat. Since this requires some type of mount, I decided to make

Photo B. The author has a separate bag for his portable ham gear, including a mini-logbook for keeping track of contacts while away from a logging computer.

use of the belt clip by taking a piece of scrap sheet metal and putting a bend in it — this also makes for convenient bookends in my radio room. Scrap sheet metal can be found at work (depending upon where you work) by rummaging through scrap in the machine shop, or at a heating / air-conditioning place that has scrap metal in their shop (*Photo C*). This stand, though, is needed only if you're operating with the antenna on the radio in order to maintain vertical polarization. On the other hand, if you're taking along a magnetic mount either one with an antenna already on it or a mag mount with a BNC connector that will accept almost any scanner or H.T. antenna used on your radio (*Photo D*), this stand will not be needed. As an alternative — if you're concerned about scratching your car's paint or the effect of repeatedly slamming a car door on coax cable — the window mount in *Photo E* might be an option.

Speaking of using antennas not installed directly on the radio itself: In the majority of applications using the antenna on the radio itself works reasonably well. On the other hand, if you're using your radio equipment while at the family picnic and are lounging near your car — maybe even using your car battery as your power supply, — there are definite advantages to using a mobile antenna — or at least using your radio's antenna on a mag-mount base on the car (preferably on the roof) to make use of the car's ground-plane.

Conclusion

The objective here has been to make portable work as painless as possible: Having everything easily transportable while minimizing the risk of missing a vital piece of equipment. Not only does this make operating easier but will also (hopefully!) minimize any negative experiences during radio operation *and*, in so doing, also minimizes the chances of upsetting traveling companions by imposing any "radio headaches" on them! Happy operating!

Photo C. A bent piece of scrap sheet metal can serve as a lightweight and portable stand for a handheld, especially when using it with a speaker-mic.

Photo D. A magnetic mount with a BNC connector can accommodate just about any antenna that also works with your handheld radio.

Photo E. An antenna window mount can come in handy if you're concerned about a magnet mount scratching the paint on your car's roof or trunk lid.

Quick setup and teardown, along with reliable power, are essential elements of a portable HF station, whether for emergency / disaster use or for just plain fun, such as Parks On The Air activations. K3SKS updates us on improvements that he and his wife have made in their mobile setup since he first wrote about it last January.

Persistent Practice Produces Positive POTA Progress

One Ham's Journey in Portable Operations Continues

BY STEVEN K. SMITH,* K3SKS

This is a follow up to my article, "One Ham's Journey in Portable Operations," that appeared in the January 2022 edition of *CQ* magazine. The initial article's intent was to explain the need for continuous practice and improvement of portable operations so that, in the event of an actual emergency, you, your equipment, and your operating practices will have the best chance for success.

Since that article appeared, my wife, Judy, KC3JAS, has 71 new POTA (Parks On The Air) park activations, made 10,928 POTA QSOs in three different states, and I continue my role as the station engineer / pack mule. Four main areas in our operation have been improved this past year; batteries, headphone system, equipment packaging, and a small camper. Here's an update.

Photo A. The new power pack consists of three Bioenno 15-Ah LFP batteries.

Batteries

Initially, we used a 70-Amp-hour (Ah) deep draw marine battery as the primary power source for the Kenwood TS-590SG transceiver. Using a new battery, KC3JAS could operate for 4 hours running 100 watts on SSB making 60-100 QSOs per hour when the bands were agreeable. One mistake we made was to run the battery until the radio would drop out on transmit (TX), then do a quick change to the Bioenno 15-Ah LFP battery, using power pole connectors.

One adverse consequence of discharging the lead-acid battery to less than the recommended 50%, we learned after replacing one after a year, was the battery's capacity after recharge would decrease over time and the battery swap had to be made earlier in the activation. Discharging a lead-acid battery should not exceed 50% of its Ah rating, which greatly reduces the effective capacity and usefulness of a lead-acid battery as an emergency power source.

Since we already had a Bioenno 15-Ah LFP battery as a backup, I opted to replace the lead-acid battery with two more of the same batteries, giving us three in total (*Photo A*). What this enables us to do is discharge the initial battery until it has supplied 15 Ah, performing real-time measurement with a PowerWerx Power Monitor, then quickly swap out the battery with a fully charged one. With three batteries, we carry 9 hours of pretty heavy-duty SSB capacity, and if we have access to 120-volts AC (camping, picnic pavilion, or generator), the first discharged battery can be recharged before it is needed while the second one is running, making the third battery a redundant backup.

If the 70-Ah lead-acid battery is limited to 50% discharge, the safe avail-

* Email: <s_k_smith_75@yahoo.com>

able capacity is 35 Ah, whereas the three Bioenno 15-Ah LFP batteries can safely supply 45 Ah at about half the total weight of the lead-acid battery. Seems like a no-brainer decision, but in my defense, I am considered to be a bit "frugal" (three Bioenno 15-Ah LFP batteries cost about $450, the lead-acid battery ran about $125) and thought I might have been able to get away exceeding the recommended operating parameters of a lead-acid battery. Once again, Mother Nature won.

Headphone System

Judy uses Heil Pro 7 headphones for her activations and has some hearing loss in one of her ears. Although the Pro 7 has a left side balance adjustment, this proved ineffective to supply the sound levels she requires for good, balanced audio. To address this problem, I added a PreSonus HP4 4-channel headphone amplifier with a TalentCell Rechargeable 12-volt 6,000-mAh / 5-volt 12,000-mAh DC output lithium-ion battery pack (*Figure 1*). The small battery pack was selected so that no peripheral equipment would consume power from the primary radio battery.

In addition to providing independent adjustable left and right audio levels to the headphones, a second operator can plug their headset into the amplifier to monitor the audio from the radio. This works great for two operator contact / logging functions on Field Day.

Equipment Packaging

Photo B shows our packed-up equipment from the setup in the original article. While Station 1 is packaged very efficiently, individual components (radio, battery, headphones, headphone amplifier, amplifier battery, foot switch, logging computer, etc.) need to be unpacked, placed on a table, and interconnected — then disconnected and repacked when we go QRT.

This results in several potential problems; connection errors, connection wear, especially the radio power connection, cable wear due to repeated winding and securing, and the sense of urgency KC3JAS has when we are setting up.

To improve on our setup and teardown process, Station 1 has been repackaged using a Gator 19-inch rack container. Equipment is mounted on the rack tray, with fixed intercon-

Figure 1. Headphone amplifier connection diagram

Photo B. Two portable HF stations, three antennas, as described in January 2022 article.

nection wiring and a minimum of external connections at the front and back of the open rack. The connection diagrams (*Photos C* and *D*) show the necessary connections that need to be made (red circles) during setup and teardown.

The transceiver is secured to the rack tray using the mobile bracket supplied by Kenwood and the stereo amplifier, and wiring harnesses are secured to the tray using Velcro® pads for easy removal, if needed. A sliding drawer is included in the rack to hold notebooks, pens, and reference information (band plan, considerate operator frequencies, etc.).

The battery is to be placed beside the rack and connected using the Power-Pole connections. Not placing the battery inside the rack was done to keep the weight lower (completed rack weight is 45.7 pounds) and to make it easier to change the battery. All batteries and chargers fit nicely in a repurposed CPAP machine bag shown in *Photo A*.

Setup requires placing the rack on a table and removing the front and back covers. At the side of the rack, the Bioenno battery connects to the radio, the antenna is connected to the rear of the TS-590SG and the small battery pack is plugged into the headphone

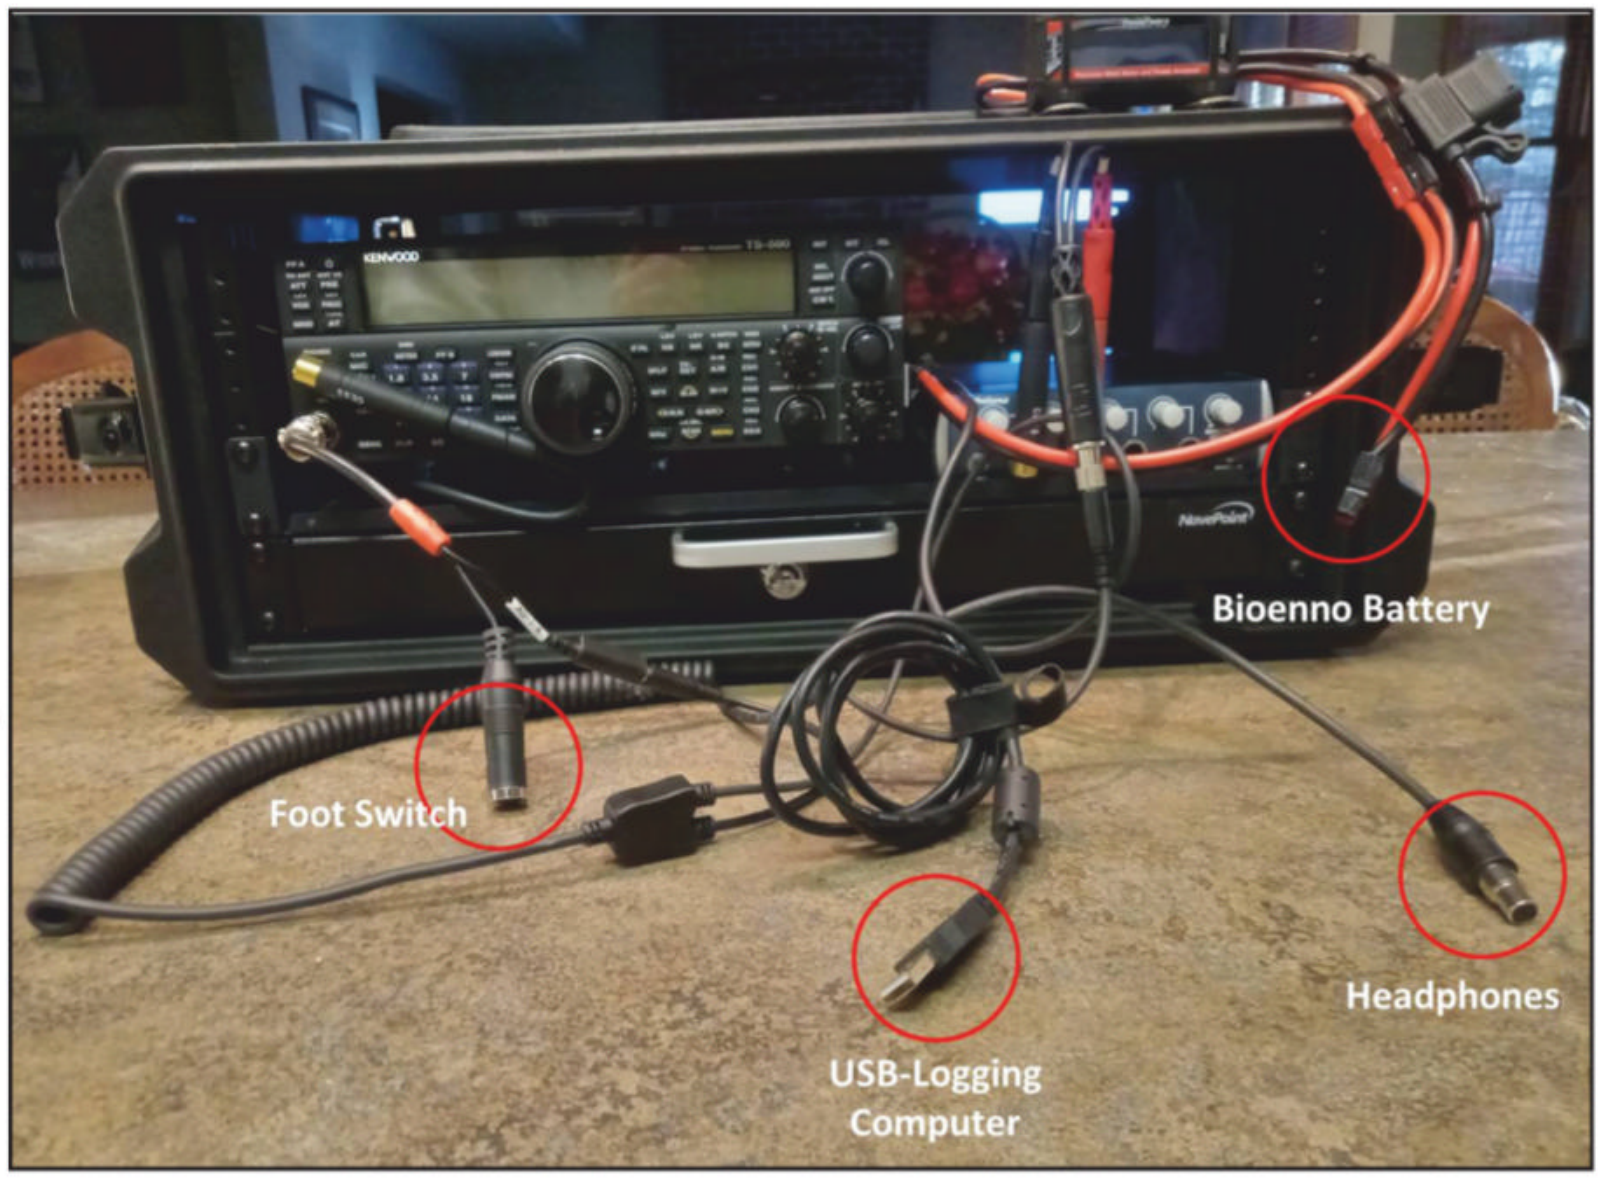

Photo C. Station 1 repackaged in a 19-inch Gator case, with circles showing the minimal number of external connections required.

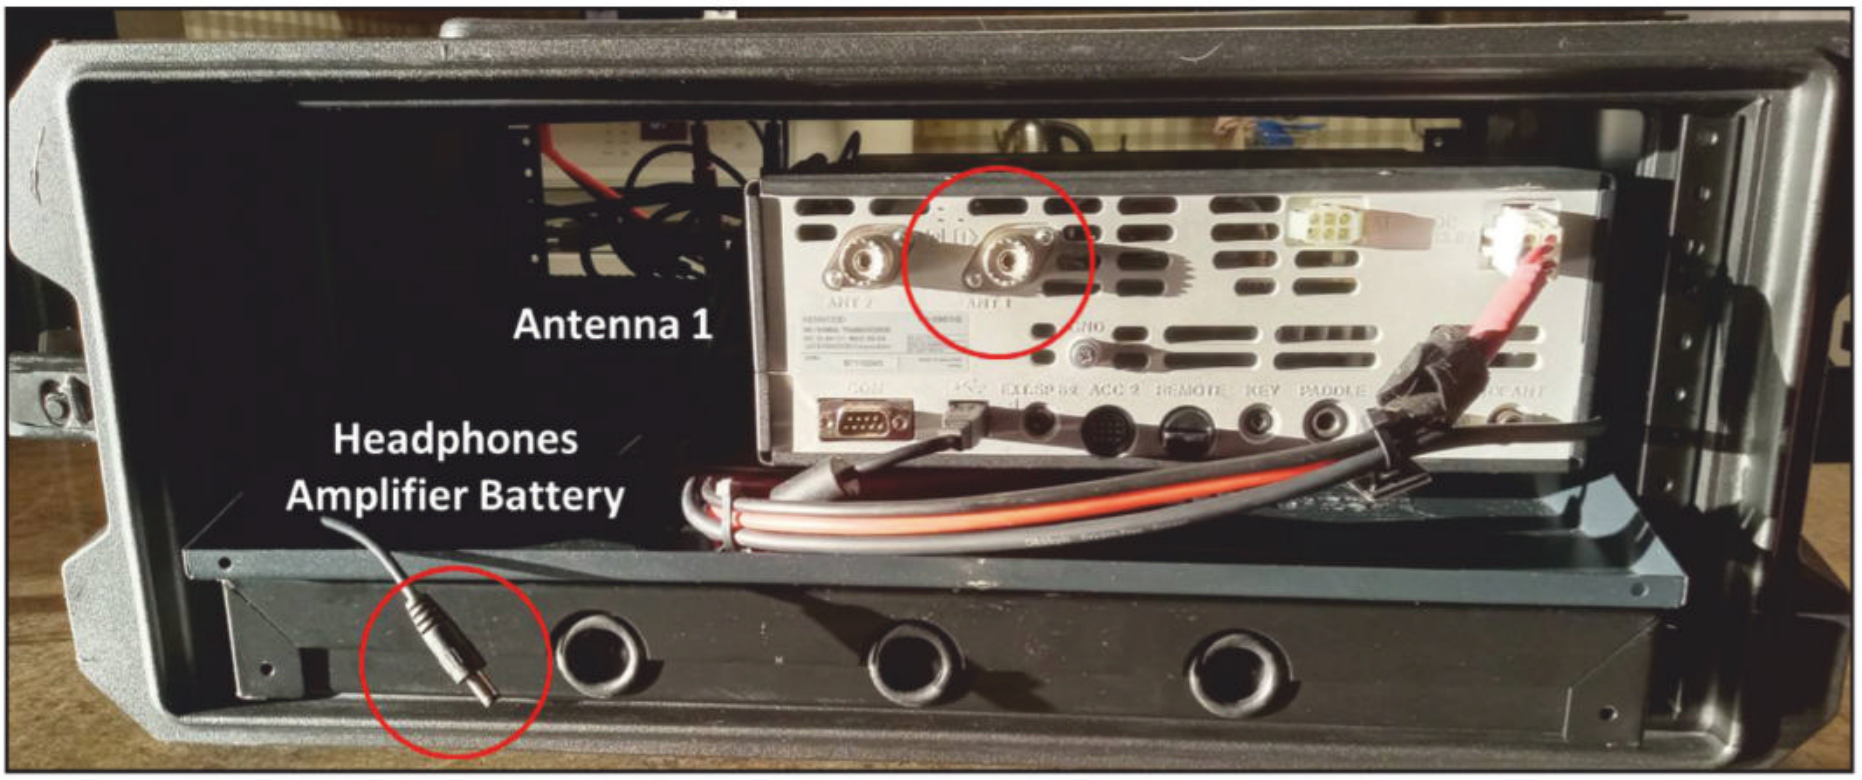

Photo D. Rear view of the Gator case, again with interconnections circled.

Photo E. POTA activation at Parker Dam State Park, Pennsylvania.

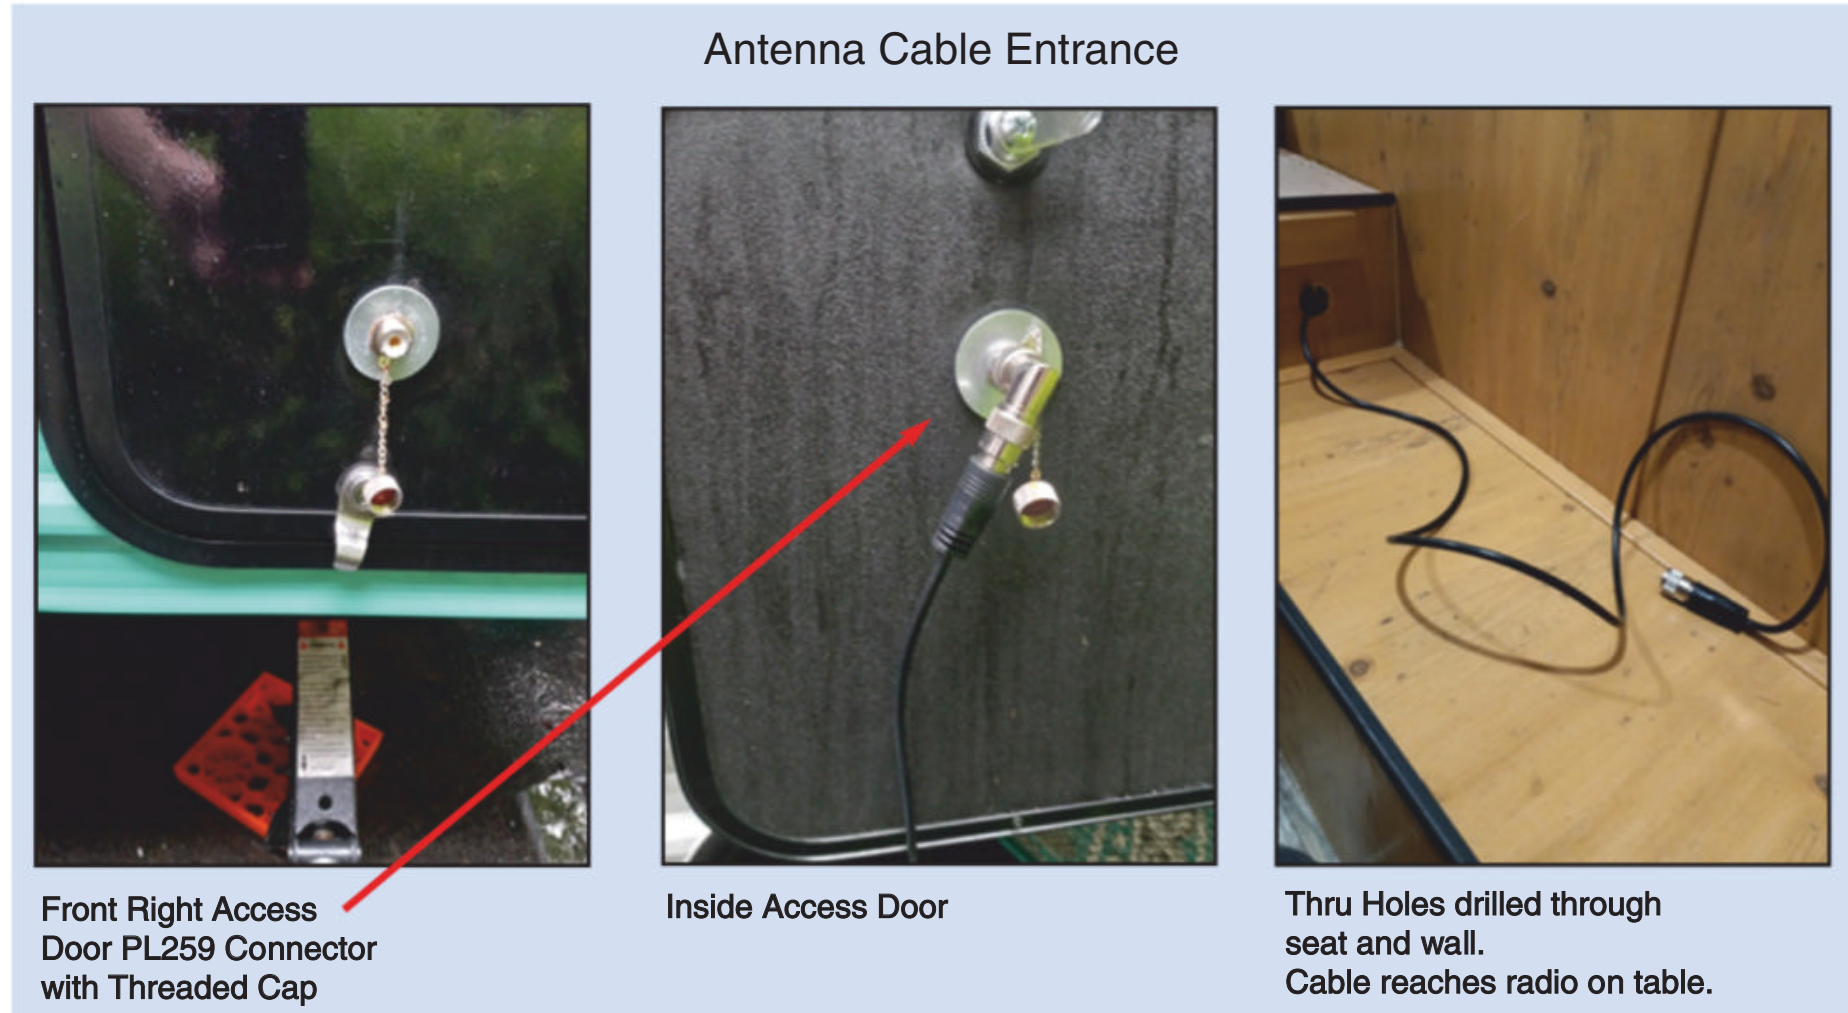

Photo F. Routing the feedline from the outside antenna into the dinette area of the camper.

Photo G. Power cable into dinette area terminates in a PowerWerx DC connector.

amplifier power connector in the rear and set inside the rack. The front connections are for the foot switch, the headphones, and the USB cable to the logging computer and then we're ready for power up.

Camper

The most significant change to our POTA activations was the addition of a small "couple's camper" so we could extend our daytime operations to overnight trips in the state parks. The camper specification was for a unit that could be towed with our existing vehicle, could sustain standalone operation ("boondocking") for two nights, and have all the comforts of home. We didn't bust our fannies for over 50 years to rough it.

The Sun Set 16BH (*Photo E*) ideally suited our needs. After I set up the camper for inside operating by tapping into the two on-board batteries, using the existing fuse panel, and an outside connection for our antennas that brings the feedline into the dinette area in the camper (*Photos F* and *G*), we were ready to go.

To Be Continued

I thought about closing with a "Conclusion" section, but if you truly are serious about continuing to improve your systems, you never reach a conclusion; you just keep getting better and better. Looking forward, I think my big challenge this year is going to be antenna setup improvements. I am pretty sure, once KC3JAS uses her new rig setup and is ready almost in the blink of an eye, I had better have the antenna ready to go at about the same time or I'm going to hear about it. It could be a long summer.

– 73, K3SKS

CQ CLASSIC

The More Things Change …

It's said that the more things change, the more they stay the same. That is certainly true of one aspect of ham radio — DXing and DXpeditioning. Over the last several months, our DX column has been featuring DXpeditions to various parts of the globe, and January's cover story was on a DXpedition to the Vatican. So, when we took a look back exactly 50 years to what *CQ* was reporting on in March 1973, what else would we find but a DXpedition? This one was to Mt. Athos, a place more remote in time than in distance. So, without further ado, here is this month's CQ Classic, "SY1MA: Mt. Athos DXpedition," from the March 1973 issue of *CQ,* for you to see what details of DXing have and haven't changed in 50 years. – *W2VU*

SY1MA: Mt. Athos DXpedition

BY VINCENT S. DANIELS,* WB4USR/SVØWJJ

As is usual with anything I do, the trip got off to a late start from Athens on the night of October 12, 1972, on our way to the first amateur radio operation from Mount Athos. Mount Athos has been recognized as a new amateur country, and is probably the last one that will be found in Europe. After catching a couple of hours of sleep in the Greek city of Salonica, we set out over the twisty road to coastal village Uranopolis, a small village port which provides the only route to Mount Athos. Our arrival at the village, behind schedule of course, occurred just as the small boat to Mount Athos was about to leave. With all haste we loaded the 1500 watt Honda generator, the Yaesu FT 101, antennas and all the other paraphernalia onto the skiff and jumped aboard.

Our first sight of the monks of Mount Athos came to us on board this small shuttleboat. Bearded, dressed in black robes and with ages of wisdom written on their faces, the monks cast a majestic image. The little boat wound its way along the coast, stopping at each monastery along the way to pick up or discharge passengers, food, mail, or whatever.

After docking in Dafni, the port village of Mount Athos, we passed under the wary eye of the customs official and made our way to the 1950, (give or take a few years), Mercedes 4-wheel-drive diesel bus which is the only mechanized public transportation in the country. It resembled a left over WW II armored personnel carrier. We should have known right then that to turn back would be the smart thing, but I was never one for letting evil omens bother me. For instance, the fact that the DXpedition started operating on Friday the 13th had no effect on my morale whatsoever. After some amount of discussion we loaded the gear aboard the bus and started our trip over the mountain ridge to the administrative center of Mount Athos, the monastic village of Karyes. The "road" was no more than a wide donkey trail, gutted by rain and always precariously close to the edge of a cliff, which dropped directly into the sea. Din, SV1DB, got seasick—on the bus—not on the boat, but we held on and made it over the mountain, and finally descended into the village of Karyes.

Upon exiting the bus, we entered the Middle Ages. Modern times do not exist in Mount Athos. There are practically no vehicles, no motors, no noise, no electricity. All cooking is done on large wood burning stoves, such as the one in the inn in which we stayed. Oil lamps supply light during the night time hours, and everyone is usually sound asleep by 8 P.M.

One other very noticeable item is lacking from Mount Athos: females! The country is a mans' world and females are not allowed to enter its boundaries. The rule is not

Mount Athos, The Holy Mountain

Mount Athos is a small religious country which occupies a peninsula on the northern coast of Greece. Since the time of the Byzantine empire in the 10th Century, Mount Athos has enjoyed self government and the area is administered by a Greek Orthodox monastic council, and this autonomous form of rule has been officially recognized by the Greek government since 1926. The population of Mount Athos is composed almost entirely of monks and religious hermits, of whom most live in the 20 monasteries and 12 hermitages which grace the coastline and mountains of Mount Athos.

The weather was bad as we welcomed Bill to Mount Athos. It would get worse.

We went searching the mountain for a suitable QTH. Notice the FB weather.

Bill and Din pause at the new SY1MA QTH high in the clouds of Mount Athos.

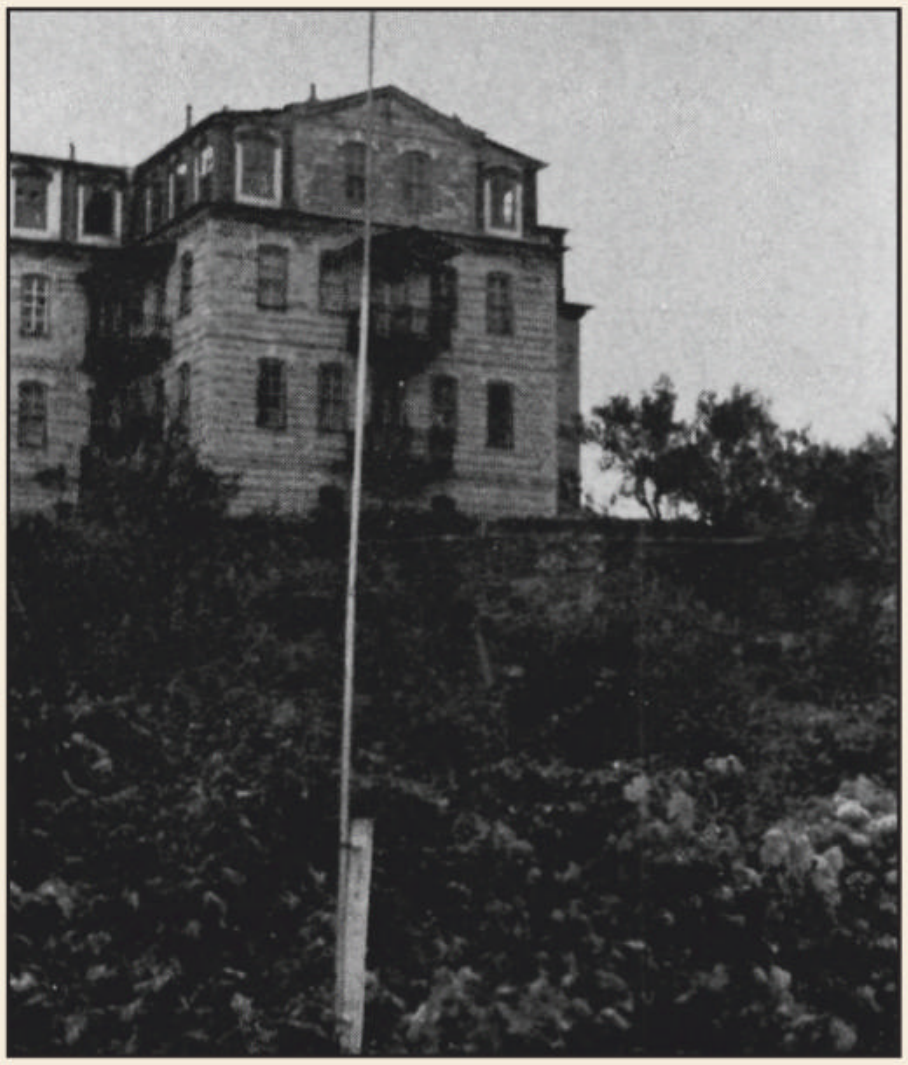
Our first attempt at a tent, with Din hammering, did not fare so well through the thunder storms.

The generator gave problems, but thanks to SV1DB and SVOWJJ things were soon back in order.

Dampened in body, but not in spirit, Vince and Bill operate SY1MA from within their plastic tent.

Roads were washed out; mule train was the only way out over the mountains.

After 1500 QSO's opening up a new DX CC country, the DXpeditioners depart from Dafni.



Our first antenna location was too low to be very good, and the generator and QSO noise disturbed the very rigid living conditions of the monks. The building in the background is one of the many monasteries in Karyes.

limited to the human species—no female animals are permitted to enter into the male sanctuary of Mount Athos. So do not count on a contact from here for the YL-DXCC.

After settling in the local inn, we took care of the administrative chores and got right to setting up the generator. We converted the inn to our operation center, and installed our antennas—three verticals—in the back yard garden. We rented two beds upstairs, prepared everything, turned on the generator and went to work on 20 m. The pileup was great and JAs and locals were pounding in. We took turns working and even managed a few Ws before the band went dead at about 2000 hours. We felt defeated. Either propagation or our QTH was miserable. We went to bed with hopes of a better day in the morning. One of the problems did improve the next day—propagation was better. But then another problem came up, and at about 1200 hours we were told we would have to shut down because we were disturbing the very strict regimen of the monks with our QSO, and generator. By this time Bill, SW0WII/WA6BWB, had arrived with a second FT-101, and we were ready for the pileups, but we needed a new QTH far from the monasteries.

The weather the next morning was terrible: cold and verging on rain, but this couldn't deter us because we're hard core DX'ers. We took the 8 A.M. bus up the mountain as high as it went and then hoofed it to the top of the ridge. We walked through the clouds on the way up, but we did manage to find a fantastic location on the edge of a cliff, with a tree right there to facilitate the building of a tent. (You may be asking yourself right now where we managed to come up with tent material. Simple! We brought a 15 meter roll of $1\frac{1}{2}$ meter wide, double ply, heavy duty plastic.) We started construction of a plastic tent strung over the branches. Bill, an ex-Boy Scout called it a "faceria," meaning, "it ain't gonna work," and we saw just how true this statement was when, two minutes later, we were hit with a ferocious thunder storm. Our plastic tent became an above ground pool, then collapsed, getting us soaked to the skin, but fortunately the equipment was dry. Under Bill's expert guidance we started anew. By suspending a large branch between two trees, and draping the plastic over this support, a secure tent was completed. Folding the plastic on the uphill side back around under us for a floor, we managed to construct a good sized, sturdy, and reasonably dry tent. The rain continued, but we couldn't get any wetter so we continued to work installing antennas, positioning the generator, and improving on the usability of our temporary home.

At noon we were back on the air, soaking wet, freezing cold and nearly starving. Din and I hung our clothes on wires inside the tent to dry, but Bill just kept his clothes on. As usual his Boy Scout know-how prevailed, and when his clothes had dried from his body heat, ours were still wet and cold, so finally we followed suit, and suited up. We operated for twelve solid hours on the 15th until finally the band went dead, and we weren't too far from that state ourselves. Breaking down whatever gear was inside the tent, we packed it in plastic bags, but left the antennas and the generator outside. At 11:30 P.M. we started down the side of the ridge for the town. Try to imagine walking on a donkey path down a mountain, with only two cheap flashlights, in the middle of a fog and with rain falling all around you, and add to all this the fact that the place you are looking for has no lights to guide you in, and you will have some idea of our discomfort when we realized we were lost.

But through some miracle—it is a holy land, remember—we did eventually find our way back to Karyes for a few hours sleep before boarding the 0800 bus back to Dafni. This was our plan at any rate. We would take the bus to the top of the mountain, have it wait while we gathered our gear, and then ride it in to Dafni. That was our plan. The fact that the road between the towns was washed out tended to wash out our plans as well. We were stranded in Karyes and we had to be back to work the next morning. What could we do. Simple! We would hire mules to take us over the mountain.

Angelos, the local mule owner is quite a nice fellow, and he owns four sturdy mules which we hired, with him as guide, for only $6.00 each. With no other mode of transportation available, the price was a steal so we accepted it, and climbed on the mules. Up at the QTH we found the tent still intact and the gear dry, so we loaded everything up on the beasts of burden and started over the mountain. After about three hours of riding we reached Dafni and had a wonderful bowl of hot bean soup, our first hot food in over 36 hours, and with it some local retsina wine. A feast!

Mount Athos had been conquered: over 1,500 QSO's. And we look forward to many future DXpeditions to this new country now that it has been opened to the world of amateur radio.

Here's a VHF/UHF (and maybe a piece of HF) antenna you can build with most parts readily available at your typical hardware / big-box store. Depending on how you build it, it can be mounted permanently or easily broken down for use in portable / remote locations.

A Collapsible Tri-Band Antenna for 6 Meters, 2 Meters, and 70 Centimeters with a 10-Meter Option

BY BOB HERKLOTZ,* K4HRK

This is an easy-to-build tri-band fan antenna with excellent performance on our most popular VHF / UHF bands. It has horizontal elements for 6 meters and vertical elements for 2 meters and 70 centimeters (*Photo A*). It's fabricated with 14-gauge THNN wire and electrical PVC tubing to support the wire. Also, a 10-meter option can be easily added.

The antenna breaks down into 2-foot-plus sections for easy transport to the field (*Photo B*) or can be permanently mounted, either suspended from a tree or mounted to a mast. A 1:1 balun and PL-259 connector are built into a quarter-wave standoff to separate the coax from the lower vertical element.

This antenna can also be configured for other bands without the 2-meter / 70-centimeter elements, such as a 6- and 10-meter horizontal fan dipole with radials 90° apart.

The electrical PVC is a good supporting structure for the radiating elements and doesn't affect performance. Other electrical PVC benefits include a good strength-to-weight ratio, junction boxes, ultraviolet protection, good blending with the environment, and it's easily replaceable if the antenna is damaged. In addition, the PVC will insulate the elements from wet tree branches. This antenna does require an A/B switch, patch box, or duplexer if you're using two radios for the different bands.

The Build Procedure

Begin by purchasing the supplies in the accompanying parts list. Then refer to *Photo C* for the following steps:

** 1142 Roseland Drive*
Columbia, TN 38401
Email: <robherk@gmail.com>

~ Drill a 1-3/8-inch hole centered in the bottom of the Carlon hex box and a 7/8-inch hole centered in the box cover and de-burr the holes. Hole saws are best for this job. Clamp the work securely to prevent the pieces from spinning and causing injury.

~ Knock out two of the box "knockouts" where the horizontal wires will exit the box, or just drill a clearance hole though the knockouts for the wires to pass though.

~ Solder the horizontal and vertical elements and the feed coax to their

Photo A. The 6-meter / 2-meter / 70-centimeter antenna suspended

Photo B. The 10-meter / 6-meter / 2-meter / 70-centimeter antenna field ready

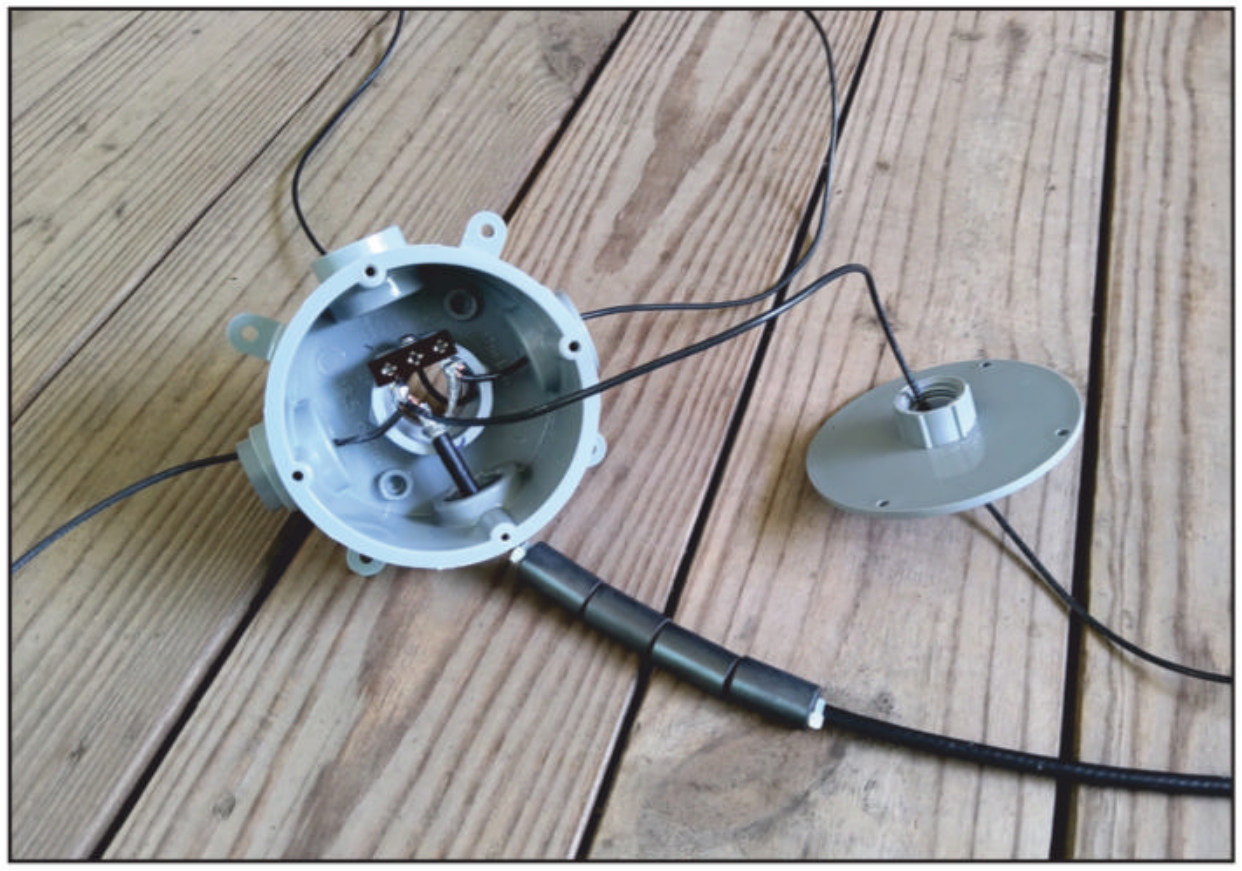


Photo C. The antenna junction box and balun detail

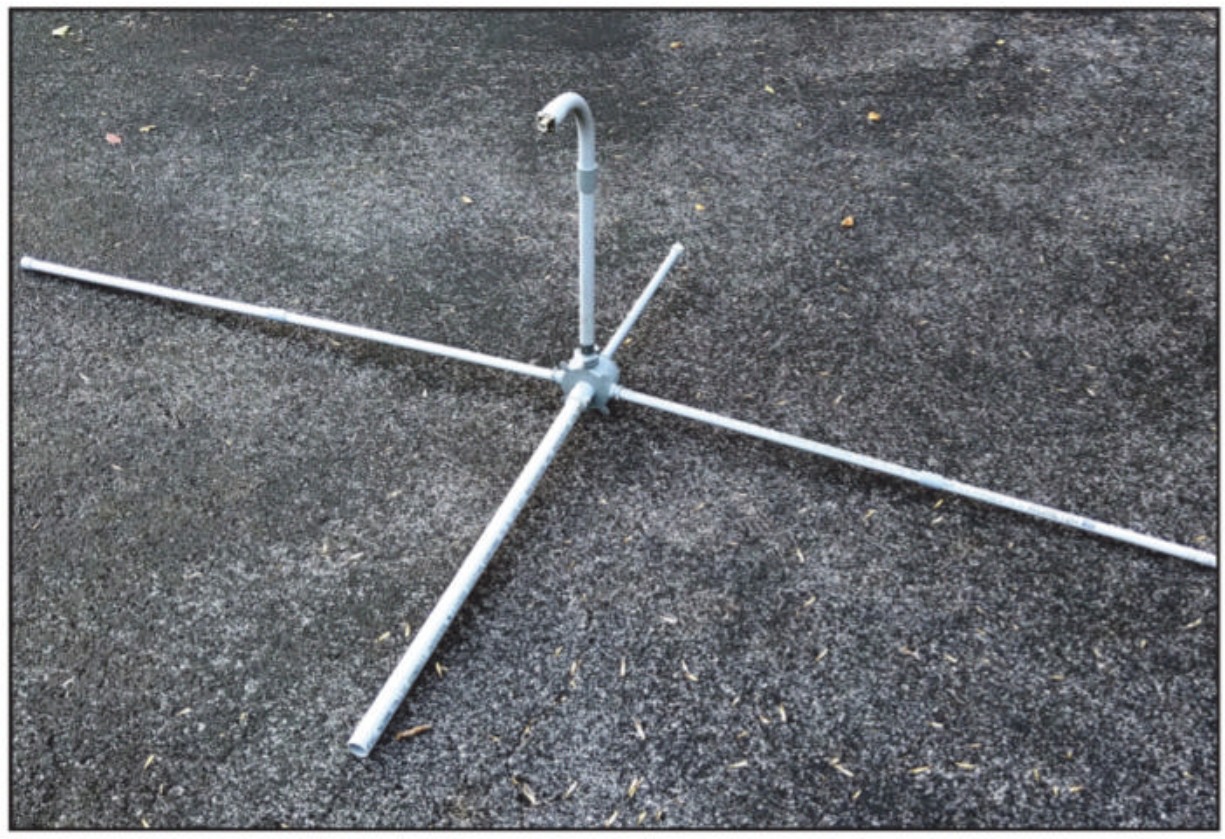

Photo D. The assembled antenna with the standoff

respective solder lugs on the terminal strip as shown in *Photo B*. A larger soldering gun will work best here. Keep in mind; this is a horizontal / vertical fan dipole, so position the wires and coax accordingly.

Note: the terminal strip is mounted on the adaptor before mounting the assembly in the box.

~ Knock out the box hole 90° from the horizontal elements where the coax will pass though.

~ Mount the half-inch male terminal adaptor into the top of the box cover and thread the half-inch female terminal adaptor onto the threads exiting the bottom of the cover. Tighten securely.

~ Cut a half-inch off the nut end of the 1-inch male terminal adaptor. There should be about a half inch of material remaining from the shoulder to the end of the nut. Position the terminal strip flat against the nut end of the adaptor as shown in *Photo B*, spot the hole and drill a 3/32-inch pilot hole for the #6 screw.

~ Slide the bottom 2-meter / 70-centimeter wire though the adaptor, then mount the terminal strip with the attached elements to the adaptor.

~ Mount the adaptor into the hole at the bottom of the box, sliding and pulling the wires and coax though its respective ports in the box and cover when lowering into position. Screw the 1-inch female terminal adaptor onto the threads exiting the box and tighten securely.

To Glue or Not to Glue …

If you're using this antenna for portable or field deployment, you'll want easy assembly and takedown, so use PVC adhesive to glue only those pieces specified in the steps below. If this is a base station antenna, glue all the PVC pieces during assembly. This will bond the joints, resulting in no wobble and more security.

~ Apply PVC cement to two of the 3/4-inch to half-inch tubing reducers supplied with the box and push them tightly into the box holes from which the 6-meter radials exit.

~ Secure the cover to the box with the supplied rubber seal and screws.

~ Slide the four ferrite cores onto the coax. Butt them against the box port opening and capture them in that loca-

tion with a plastic wire tie at the other end. This completes the box build.

Building the Balun, 2-Meter / 70-Centimeter Standoff and Connector Assembly

Note: Refer to *Photos D* and *E* for the standoff build.

~ Apply PVC cement to the joints and slide the straight 3/4-inch PVC tubing over the coax and push it into the box.

Photo E. The SO-239 connector mounted on the standoff

~ Apply cement to the end of this tubing and push on the 3/4-inch coupling, then glue and push the 90° radius tubing into the coupling, taking care to align the vertical portion of the bend facing the ground when the antenna is mounted.

~ Apply cement and push a 3/4-inch to half-inch adaptor into the 90° bend hole.

~ Trim the coax exiting the adaptor about an inch from the adaptor. Strip the coax and separate the shield and center conductor, then solder the leads to the SO-239 bulkhead connector.

~ Push the coax and connector into the adaptor and align the holes with the adaptor "ears."

~ Spot and drill pilot holes for the #4 sheet metal screws, then secure the connector.

~ Seal the connector where it mates the adaptor with RTV or weatherproof caulking.

~ Remove any kinks or bends in the wire elements and push two of the 6-meter and the 2-meter / 70-centimeter PVC support tubes into their respective element sockets. Then slide on the half-inch couplings and the other 6-meter PVC tubes.

Note: if this is a base station build and you don't need a "breakdown" antenna, you can just use one appropriate length tube on each side. This completes the initial build.

Tuning Procedure

~ Remove the vertical and end horizontal tubes and use a VNA (vector network analyzer) or antenna analyzer to trim your elements for 1:1 SWR on the part of the bands where you want the best resonance. I settled for the middle of each band. If you're a CW and digital fan, consider the lower end of the bands. Trim about a half-inch each time and a quar-

Photo F. The mast-mounted 6-meter / 2-meter / 70-centimeter tri-bander

ter-inch when you get closer. It's better to trim just a little each time than to add wire if you've missed your mark.

~ As you tune, the other tuned band elements may detune slightly, so check for this. This did not happen for me. Also, the tuned elements are shorter than typical dipole lengths. I attribute that to the PVC and the insulation on the wires.

~ The vertical elements may also be cut for other bands, such as 222 MHz, marine, or the aviation band.

~ When the elements are tuned, trim the PVC tubing to match the element lengths and glue on the caps. Don't glue the caps if you're extending the PVC tubes for other bands (see below). Also, don't trim the lower vertical 1-inch tubing if this antenna will be mounted on a mast. You'll want vertical clearance between the mast and mounting hardware and the element.

Other Band Builds

If you build this antenna with 6-meter horizontal elements, these elements can be easily extended for 10 meters. Just add a "Molex"-type quick disconnect at the end of the 6-meter elements, with a mating disconnect on the 10-meter "extension" wire. Add a set of PVC couplings and tubes to accommodate the additional length and you've changed bands. Be sure to tune the elements with the connectors in place. The 10-meter elements will droop, approaching an inverted-V, but performance won't be affected. Consider using PVC cement when assembling these elements for a secure connection.

If you don't need the 2-meter or 70-centimeter bands, consider using separate 6- and 10-meter horizontal elements mounted on the box, 90° apart. You won't need the coax offset and top vertical tube, so use the bottom vertical tube for the coax feed and capture the ferrite there. Follow the procedure listed above for mounting the SO-239 connector at the bottom of the tube, but use both a 1-inch and 3/4-inch reducer in tandem to accept the connector.

Mounting the Antenna

This antenna can be mounted on a mast (*Photo F*) or suspended (*Photo A*). If mast mounted, use the mounting kit in the parts list. Be sure to use enough separation between the metal hardware and the lower vertical element (if used).

If the antenna is suspended (*Photo A*) and the vertical elements are used, mount the tubing clamp (in the parts list) on the standoff about 1 inch from the box, thread and tie the lifting line though the hole in the clamp and raise the antenna with the coax attached to the desired height. The clamp will probably need to slide laterally on the standoff, depending on the weight of the coax. Adjust the clamp to balance the antenna so the vertical elements are truly vertical, then capture the clamp with tape or wire ties on the tubing. A heavy-duty wire tie can substitute for the clamp. With the antenna suspended, the coax can be used to orient the antenna.

If the antenna is suspended without the vertical elements, standoff and tubing clamp, the mounting "ears" on the box

can be used to fabricate a cross support point — no balancing necessary.

Performance

Using my VNA, these are my standing wave ratios on different bands:

~ 10 meters – 1:1 center of band and 6:1 at the edges
~ 6 meters – 1:1 center of the band and 9:1 at the edges
~ 2 meters – 3:1 flat across the band
~ 70 centimeters – 1:1 flat across the band

Propagation is excellent on 10 meters, 2 meters, and 70 centimeters, hitting all the local repeaters with full quieting on 2/70 and QSLs and beacon contacts all over the globe on 10 meters. I'm sure propagation is comparable on 6 meters, but the band was closed whenever I tested. I did hit beacons 67 and 53 miles away, so I know the 6-meter elements radiate.

You should find this antenna is easy to build, portable, versatile, and a good performer with many band options. With both mast and tree mounting capability, it will serve you well in both a base and field environment.

Parts List

Note: All PVC parts are standard electrical (gray) tubing, fittings, wire, and screws are available at most hardware stores. Also, wire and tubing lengths are longer than needed to allow for tuning.

Carlon 3/4-inch PVC junction box, type X, with cover and reducers, model #E970CDE-CTN, Home Depot
1/2-inch male terminal adaptor
1/2-inch female terminal adaptor
1-inch male terminal adaptor
1-inch female terminal adaptor
2 lug terminal strip
1 pc. #6 stainless steel sheet metal screw, 3/8-inch long
14-gauge THNN wire: 2-meter elements – 2 pcs., 21 inches long; 6-meter elements – 2 pcs, 26 inches long
4 pcs. 1/2-inch tubing, 26 inches long
1 pc. 1/2-inch tubing, 22 inches long
2 pcs. 1/2-inch standard coupling
1 pc. 3/4-inch electrical PVC tubing, 16.5 inches long
1 pc. 1-inch electrical PVC tubing, 32 inches long
3 pcs. standard end cap
1 pc. 1-inch standard end cap
1 pc. 3/4-inch electrical PVC 90° elbow, standard radius with belled end
1 pc. 3/4-inch standard coupling
SO-239 chassis coax connector
4 pcs. ferrite sleeves, #FB43-5621, Digi-Key #1934-2643625102-ND
4 pcs. #4 stainless steel sheet metal screws, 3/8-inch long
RG8X coax, 32 inches long
3.4-inch Tubing snap strap
Miscellaneous: wire ties, caulk, PVC cement, 3/4-inch PVC support strap — Carlon E978ECR or similar, Slinkdsco double antenna mast clamp (2 sets, Amazon — If you mast-mount this antenna).

If you build the 10-meter extension elements:
14-gauge THNN wire: 2 pcs. 46 inches long
2 pcs. 1/2-inch tubing, 46 inches long
2 pcs. 1/2-inch standard coupling

N2EWS wraps up his tale of getting back on the air after a many-year absence, and operating from an antenna-restricted housing development.

The Continuing Anticlimactic Adventures of the Perverted V (Part 3)

BY NICHOLAS PETRELEY,* N2EWS

This is Part 3 of a story that started with an antenna I call a "Perverted V." It is a freakishly disfigured inverted-V in which the center is only 20 feet high, attached to a flagpole in the corner of the yard. The two legs of the antenna are at right angles to each other, and one leg bends at the corner of the fence and runs a bit parallel to the other leg (*Photo A*). Not ideal, to say the least, but so far it has fooled the homeowners' association (HOA).

As promised in the previous installment, let me tell you about the weird behavior with and without the 4:1 balun. I attached coax directly to the 450-ohm ladder line. It worked fine. When I added the 4:1 balun, it didn't tune very well, which is odd, since a 4:1 balun is recommended for this kind of antenna.

My setup was configured like this:

Transceiver -> Tuner -> Diamond SX-100 power meter -> Antenna

I changed the coax patch cords for an entirely different reason, but inadvertently changed the setup to:

Transceiver -> Power Meter -> Tuner -> Antenna

Suddenly I couldn't get a reasonable SWR on any of the bands. So, I added the recommended 4:1 balun, and everything works fine. It's almost as if putting the power meter between the tuner and the antenna tricked the tuner into working without the balun. I have a feeling that's not a good thing.

Speaking of tuners, I didn't have much luck with the eBay sourced automatic antenna tuners I tried. This time, however, I purchased a new MFJ-939Y automatic antenna tuner from Giga-parts. This tuner knocks my socks off and makes them dance around the room. The first time I transmitted, it went clickety-clickety-click-ping, and the SWR is 1:1 or close. I changed bands to a spot I visited previously, and ping, it's 1:1 again. As God is my witness, I shall never go manual tuning again.

However, I'm still stuck with my insufficient "Perverted V" antenna. Short of building a magnetic loop, the "Perverted V" is all that will prevent my HOA from complaining.

But I accidentally discovered a way to get around its limitations, at least when it comes to reception. When I connect this abomination of an antenna to a $30 RTL-SDR software-defined radio USB dongle and listen to ham bands via the SDR-Sharp software on the computer, signals come through very clearly. Software-defined radio seems to overcome some of the limitations of my antenna. So, I decided to bite the bullet and shell out what it takes to upgrade to a hybrid transceiver that includes an

Photo A. The "Perverted V" as seen from the front yard. Looks like the flag needs replacing.

** 1034 Chad Loop*
Round Rock, TX 78665
Email: <nicholas@petreley.com>

Photo B. My station with the SDR radio installed.

SDR. It won't make my transmitted signal any stronger, but it should help with what I receive.

The Yaesu FTDX10 goes for more than I want to pay, but I commit and snag the FTDX10 from DX Engineering (*Photo B*). The FTDX10 has a DVI output and USB ports for a keyboard and mouse. A unidirectional DVI to HDMI cable should work very well to operate the rig using my PC monitor. If you get such a cable, make sure it's unidirectional. You don't want HDMI sending things in the other direction as it is wont to do.

If you don't want to mess with a cable and a keyboard and mouse for the FTDX10, Ham Radio Deluxe lets you operate your rig from your computer and its keyboard and mouse. In fact, allow me a couple nitpicks with the FTDX10 as compared to Ham Radio Deluxe. I have a USB switch that lets you use one keyboard and mouse for multiple devices. You can't do that with the FTDX10. It doesn't know how to deal with the USB switch. I need to dedicate a keyboard and mouse to the rig. Furthermore, you can't change frequencies on the FTDX10 with the mouse scroll wheel.

In contrast, Ham Radio Deluxe is a PC application, so there's no need for a USB switch. And the interface lets you increase and decrease the frequency with the mouse scroll wheel.

So, Yaesu, if you're listening (or, rather, reading), how about updating the firmware to allow a USB switch, and make it possible to tune with the mouse scroll wheel?

Speaking of tuning, the frequency tuning method on the FTDX10 is one area where I immediately miss my previous (non-SDR) IC-7410. With the IC-7410, I press one button and tune in 1-kHz steps. Press it again, and I'm back to fine tuning. People transmit on an even 1-kHz frequency so often that I find that feature to be extremely useful. From what I understand, with the IC-7300, you touch the kHz section of the display, and you tune in 1-kHz steps. Touch it again, and you go back to the default. Same feature, different activation / deactivation methods.

The FTDX10 works almost the same way. Almost. You touch the kHz section on the display, and it tunes in 1-kHz steps. Then it goes back to the default tuning steps after you stop tuning around. I want to set it on or off. I don't want it switching off on its own. Worse, my fat fingers often hit the outer dial while tuning the 1-kHz steps (there are two tuning dials on the rig — the main dial and an outer ring). Touching the ring cancels the 1-kHz steps.

I dig deeper into the Yaesu settings and, lo and behold, I see that I can set the rig so that when I press the STEP/MCH button, it tunes 1 kHz at a time using the outer ring. I can still use the main dial for finer tuning. That's a game changer for me. In case you have a different preference, you can configure the button to change the outer tuning ring to a variety of different steps, up to 10 kHz.

In the end, I'm very pleased with the FTDX10. I can pull signals out from under the noise, especially when I invoke the digital noise reduction button.

So how is my new gear for transmitting? I still don't get great signal reports. But I can check into various nets and almost always get heard. And remember, I logged only three FT8 contacts over the entire Field Day weekend with my former gear. With these shiny new items, I've logged over 300 contacts using FT8 at 10 watts, including 40+ countries. Now, whether the difference is the equipment or it not being Field Day is anyone's guess. But I'm one happy camper now.

Learning Morse code is one thing, but learning to copy comfortably — hearing whole words instead of individual characters — is something else entirely. WØFN has tips on upping your skill level by learning "sound shapes" to make CW QSOs a pleasure.

Learning Morse Code Instant Character Recognition (ICR)

BY TOM WEAVER,* WØFN

Instant Character Recognition requires knowing your Morse code ABC's. That's all. Morse code comprehension isn't complicated, but it does takes time, diligence, and study. By comprehension, I mean listening to Morse code, not writing letter-by-letter, then reading it later to see what was said.

Have someone quickly spell a common 4- or 5-letter word out loud to you. Like HELLO or GREEN. Did you recognize each letter? Did you "get" the word? Was it difficult? Probably not. You've experienced Instant Character Recognition and "word building" because you already have ICR with the spoken alphabet.

Did understanding a spelled word require a special technique? Nope — all it took was knowing your ABC's and a little spelling. When Morse code sounds are synonymous with their spoken letter sounds, you've achieved ICR. However, truly knowing your Morse code ABC's isn't like "remembering" them, it isn't decoding them, and it isn't a conscious process; they are too slow.

Your subconscious handles spoken letter ICR. You aren't "remembering" or consciously "decoding" spoken letters; you know them. You could think of it as having 26 finely tuned high-Q receptors that automatically "resonate" to the sound of one spoken letter each. These tuned sound receptors free your conscious mind to focus on what's being spelled instead of needing to work on recognition. Spoken letter recognition feels effortless, allowing you to build words, "go with the flow," and follow the train of thought as sentences are being spelled. Morse code ICR will feel the same.

Building and recognizing words as you listen to Morse code letters arriving in rapid succession creates a sudden need for 26 tuned high-Q receptors. It surprises students who feel confident they know the alphabet because they've been decoding dits and dahs successfully. Individual character practice will remain foundational throughout the ICR learning journey — that's why we continue to practice alphabetic ICR with ever-shorter recognition times even as we begin learning new skills. However, word building presents a much more rapid-fire recognition challenge — the necessity to deal with "character flow."

Building Words and Recognizing Cars

My group of childhood friends decided to get good at identifying as many makes and models of cars as possible. To improve my "make & model" recognition skills and (hopeful-

* Email: <tom.w0fn@gmail.com>

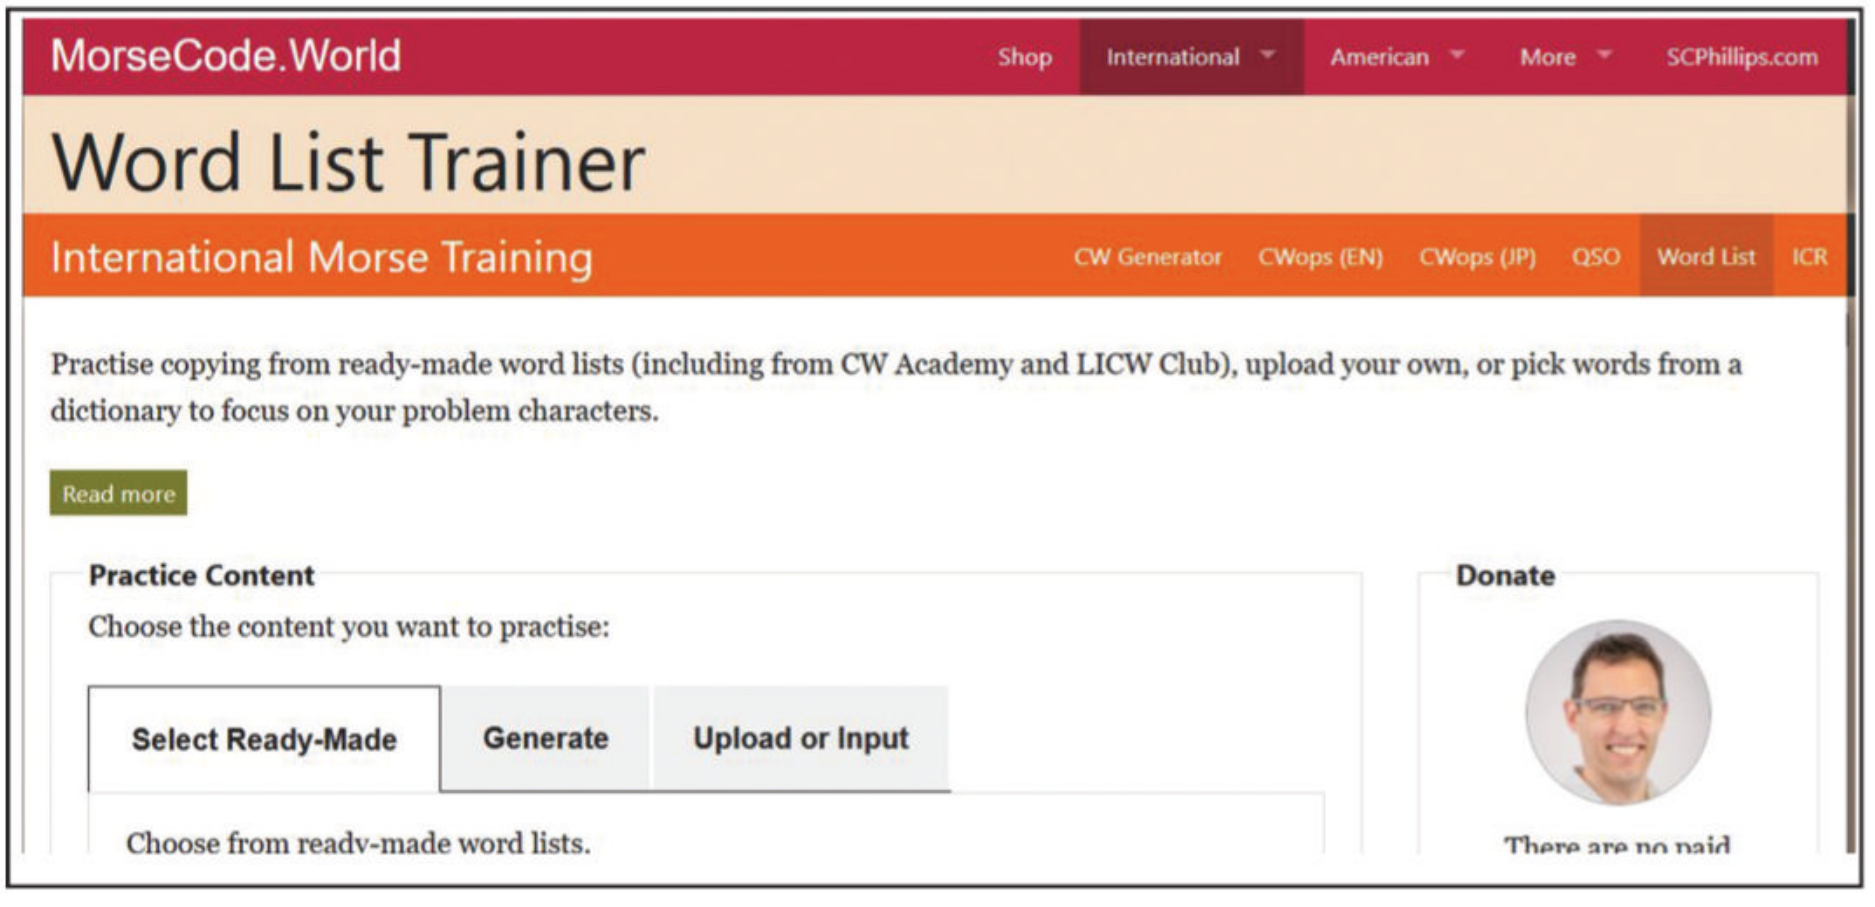

Photo A. The Word List Trainer at MorseCode.world is a good tool for learning instant character recognition.

ly) impress my friends, I studied parked cars and many magazine pictures of cars, one at a time.

Eventually, we were standing beside busy streets competing with each other as we tried to identify as many cars as possible as they whizzed by. Cars were moving fast and each one I missed really bothered me. There were some makes and models I wasn't very good with, so I focused extra hard on those in an all-out effort to win the game. At that age, it was very important to win. I kept losing — no fun!

I finally realized by concentrating on one car to ensure I got it, I missed even seeing other cars that were right behind it. I began to think that perhaps I should closely "glance" at every car as they went by and not visually follow any one car down the road. I clearly remember that risky feeling when I abandoned "trying to make sure." I decided I had to accept the ones that got past me and just see what happened. Hmmm — I started winning the game!

Tools for Practicing ICR

So, how to practice ICR? I like using *Word List Trainer* (<https://tinyurl.com/3dw6knmk> and *Photo A*) to build sound-to-letter associations. Select A-Z, make the Board and Text visible, and set the Character Speed between 25 and 35 words per minute (wpm).

Click on each letter in any order you wish or in groups of five letters and listen very carefully to each sound rhythm: Its unique and characteristic Morse code "sound shape." Rinse and repeat in three to four 5- to 10-minute sessions per day. Also click on each letter several times in a row and focus on associating that sound to that letter. Faster character speeds make hearing "sound shapes" easier. Look at the letter, click the letter, hear the code, and speak the letter. Your goal isn't to "decode," it's to make the Morse sound *be* the letter in your mind — just like the spoken letter. You're creating 26 high-Q sound receptors, and that takes time, patience, and practice. Speaking the letter immediately after hearing its code sound helps create those tuned receptors.

NOTE: If you're a beginner and you'd like to double your fun by learning Morse code twice, that's easy! Start with a slow character speed of 10-12 wpm. Then later when you're ready to learn Morse code again, set the character speed between 25 and 35 wpm and learn the alphabet a second time — by "sound shapes" instead of by dits and dahs. Be warned though; escaping from counting dits and dahs once you've learned it that way is tough. Creating high-Q sound receptors as you listen at fast character speeds, and then slowing down later is easier than learning by counting dits and dahs at 10-12 wpm and then trying to speed up.

After studying Morse code letter sounds via many short practice sessions per day for at least a week, add recognition into the game. Set Morse Count = 1, Enable "Repeat," enable "Random," enable "Speech" in Show and Say After, and set the Recognition Time between 1000-1500 ms (1 to 1.5 seconds). Click "Play" and try to "Beat the Computer" by speaking the letter before the computer does. Keep it fun and keep your practice sessions under 10-15 minutes.

You always want to miss some — adjust the Recognition Time up or down to stay in or near the "Learning Zone" where you miss about 40% and get about 60%. Missing isn't failure in this game; it's essential practice. You won't become proficient at recovering instantly from missing if you don't practice it. Recognition and non-recognition are two sides of the same coin; ICR with Morse code requires mastery (and acceptance) of both outcomes.

As you improve, drive your letter Recognition Time down – to 100 ms or less. Spend extra time on troublesome characters. Even a few slow-to-recognize letters can derail your comprehension. As you improve and Recognition Time shortens, you're transitioning from slow conscious "decoding" to the faster and nearly effortless recognition enabled by your newly created 26 tuned sound receptors. Be patient. Their "tuning" will continue to improve with time and practice!

On-Air Practice

Get on the air as soon as you know the alphabet reasonably well (assuming you have your amateur radio license) and have practiced enough with numbers to recognize most of them. Get an HF radio, a straight key, or a dual lever paddle, and put up a simple wire antenna. Being on the air supercharges the ICR learning process. In fact, achieving ICR without being on the air is virtually

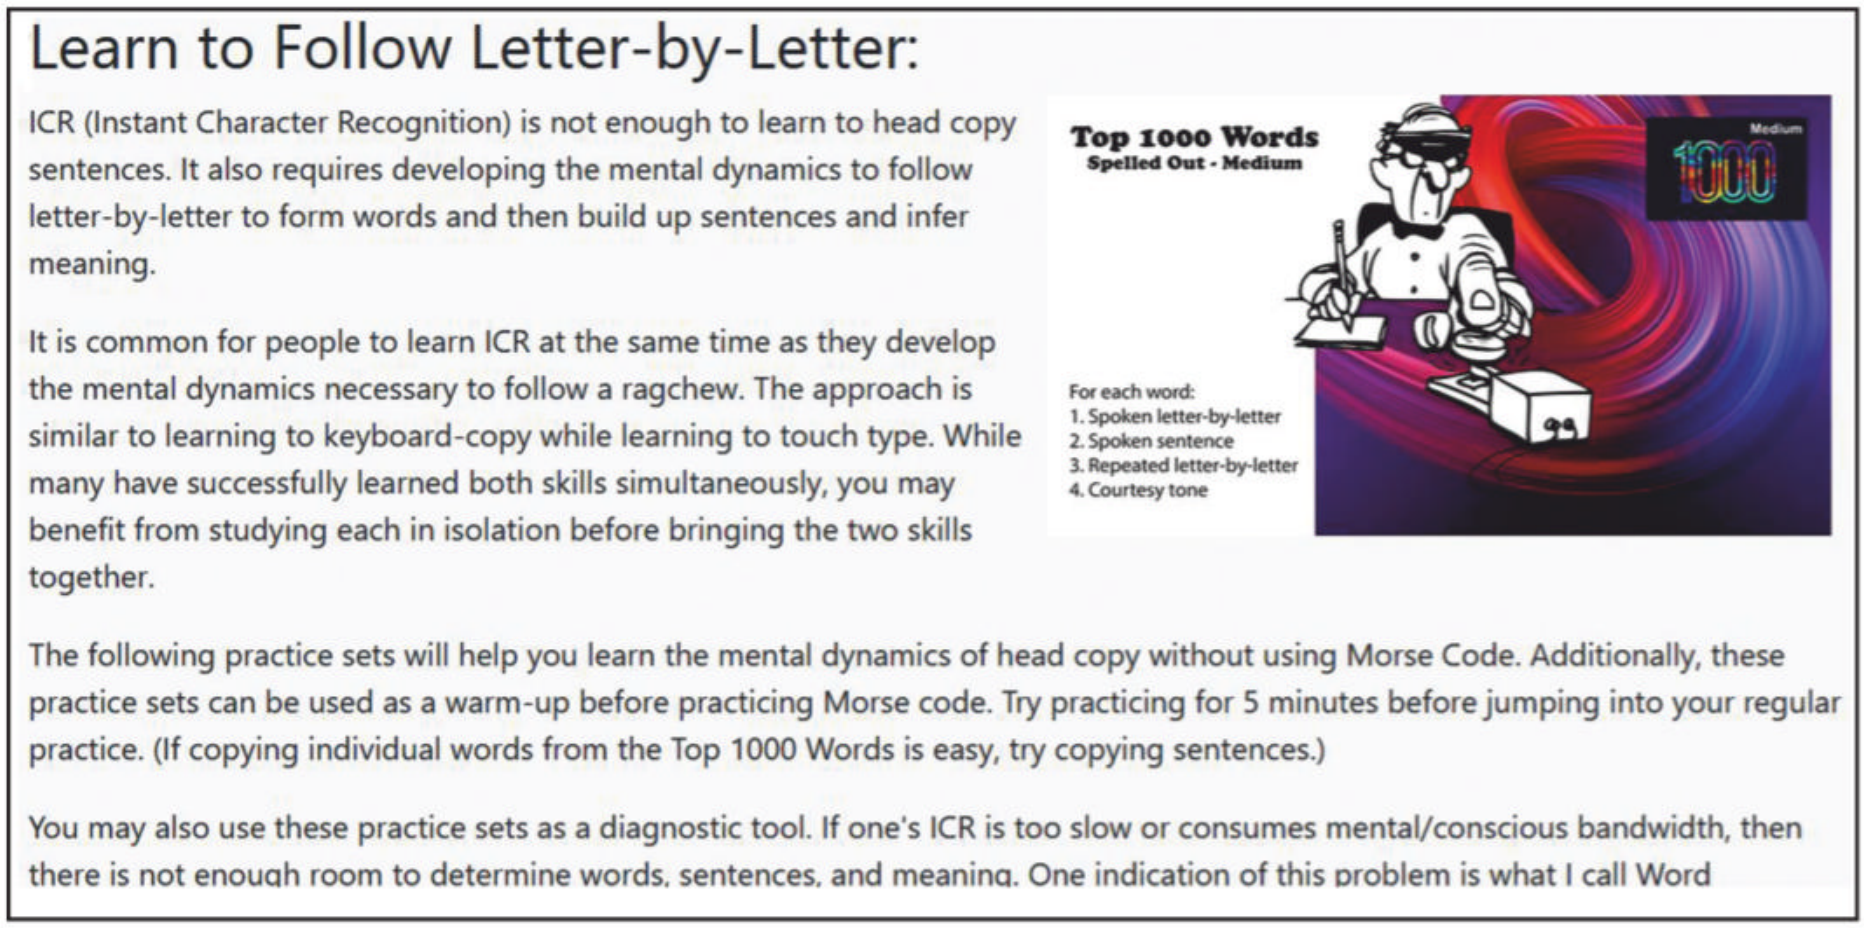

Photo B. The Letter-by-Letter section of the morsecode.ninja webpage discusses the next steps in Morse code "head copy," whole words and sentences.

impossible. As Glenn Norman, W4YES, says, "don't wait to get good to get on the air, get on the air to get good." Find a code buddy at or near your level and schedule regular on-air QSOs. Laugh about mistakes and mess up together with reckless abandon. As Dr. Seuss would say, "If you never did you should. These things are fun, and fun is good."

Variability plays an important role in mastering complex skills. Being on the air exposes you to a variety of Morse code signals at different speeds and tempos. Some good, some bad, but all are good practice. Don't worry about mistakes or not understanding what's being sent to you in a QSO; resist the temptation to write letter-by-letter — that eliminates comprehension. Just close your eyes and listen; you'll get better, and nobody cares about mistakes. Don't be the only one who cares; it will really hold you back.

Achieving Morse code ICR will begin to feel like someone is spelling words to you in English. The temptation to jump into word practice once you think you know the Morse code alphabet and leave letter-by-letter practice behind is strong. That's OK — go ahead and give it a try. You'll soon learn that word and phrase practice quickly reveal poorly tuned sound receptors and weak sound-to-letter associations. Continue working on your alphabetic ICR every day. Be patient with yourself; get on the air, and practice consistently with several short 10- to15-minute sessions per day. Keep it fun, no self-judgement allowed.

So, the initial value of word practice is a quick check on the strength of your "alphabetic ICR" skill level. Being unable to comprehend 4- or 5-letter words as letters arrive indicates "decoding," a slow and laborious conscious process. Words longer than three letters will be very difficult, and short phrases will make your head explode. You may think you know the Morse code alphabet, but you really don't. Building words as letters arrive and following a train of thought require finely tuned "high Q" Morse code sound receptors that bypass the need for conscious recognition.

See <https://tinyurl.com/2hebb46a> (*Photo B*) to see what I mean about listening to spelled-out words, phrases, and sentences. Major thanks to Stephen Phillips for creating Morsecode.world and to Kurt Zoglmann for creating Morsecode.ninja. Sincere appreciation to both of you!

The path to ICR requires building new high-Q sound receptors and/or strong sound-to-letter associations every day in addition to practicing with words and phrases and being on the air.

As you approach alphabetic and numeric ICR, your conscious mind is freed from recognition duties and on-air QSOs become more fun and less scary. Your mind will build words as the letters arrive and follow trains of thought. It begins to feel like a spoken language. ICR is a foundational skill that benefits all aspects of the art; it frees you to experience and enjoy the gratification of communicating with Morse code around the world. Sending conversational CW will feel like musical instrument mastery; it's addictive, rhythmic, and very gratifying.

Morse code comprehension using ICR on the air with other CW operators and soon-to-be friends around the world can occasionally put you "in the flow;" an amazing feeling normally reserved for world-class athletes and musicians. That rare feeling is something you permit to happen; you can't make it happen. When it does, it feels spooky it's so effortless.

Additional Resources

The Long Island CW Club <https://longislandcwclub.org> and CWops <https://cwops.org> are both great places to learn Morse code. CWops offers the well-known CW Academy and the Long Island CW Club is a large welcoming community that offers approximately 70 open classes on every aspect of ham radio and Morse code imaginable. The Long Island CW Club hosts an Introduction to ICR class by Glenn, W4YES, and me on Wednesday evenings, with perhaps other ICR classes to come in 2023. If you're a member of the Long Island CW Club, stop by sometime; we'd enjoy seeing you.

Achieving instant character recognition with Morse code is worth the effort. It's simpler than you think, it's a remarkably rewarding learning journey, and it's a great cognitive exercise.

the listening post

BY GERRY DEXTER

RFE/RL in the News

Editor's note: Gerry has been under the weather recently and was not able to complete this month's column, so we're filling in with a relevant news item and one set of loggings that crossed our desk and didn't go directly to Gerry. We hope he'll be back at the Listening Post (and keyboard) by next month. – W2VU

RadioFreeEurope
RadioLiberty

The war in Ukraine and Russia's attempts to limit objective news from reaching its citizens have brought renewed media attention to Radio Free Europe and Radio Liberty (RFE/RL). The two stations are operated by the U.S. Agency for Global Media (formerly the U.S. Information Agency) but are guaranteed editorial independence by law.

Recent RFE/RL efforts to reach listeners in Russia, Ukraine and other areas with news andinformation have been the subject of reports on CBS News's "60 Minutes" (January 1), the *New York Times* (January 24) and *RadioWorld* (January 12). The *RadioWorld* story was about the opening of new RFE/RL offices and studios in Vilnius, Lithuania and Riga, Latvia, after being forced to suspend its operations in Moscow and Minsk, Belarus. The *Times* and "60 Minutes" stories focused on the resurgence in interest in Radio Free Europe and its programming aimed at Russia and former Soviet republics.

Curiously, and perhaps in a sign of the times, however, none of the reports paid much if any attention to the "radio" part of Radio Free Europe. The focus was almost exclusively on RFE's internet streams, which seems counterintuitive, considering the ability of hostile governments to block internet access and control what is available to their citizens. Blocking radio waves is much more difficult, although jamming is a long-standing tradition in Russia and elsewhere.

Even more curiously, even the RFE/RL website makes it difficult to find the stations' on-air broadcast schedules. We had to go to <http://short-wave.info> to find RFE/RL's shortwave frequencies … which are: 5880, 7475, 9490, 9940, 11965, 12045, 12105, and 15490 kHz.

Listener Logs

Our only loggings for this month come from Allen McBroom, AG5ND, of Starkville, Mississippi, whose reports to Gerry were routed through the CQ email server. We apologize to our regular reporters for not having access to their loggings for this month. Here's what Allen has been hearing:

ALGERIA — Radio Algerienne on 15410 at 1841. Man talking in Arabic, lots of QRN, making it difficult to hear.

CUBA — Radio Havana on 15140 at 1831. Man talking in Spanish.

UNITED STATES — Supreme Master TV heard on 15770 at 1842, broadcast from WRMI in Florida. Woman talking in English about "large animal people" and veganism.

**c/o CQ magazine*

math's notes

BY IRWIN MATH,* WA2NDM

Simple Testers (Continued)

As a continuation of last month's topic, we will once again present a couple of simple, easy-to-build, circuits that we have used from time to time.

Before proceeding, however, I want to point out some facts about the RF power meter we described last month. You may remember that to calibrate the unit, we applied a 10-volt DC signal to calibrate 1 watt of power at full scale of the meter on the device. A 1-watt CW RF signal is composed of a 20-volt peak-to-peak sine wave voltage or "V_{pp}". After it passes through the rectifier diode, which cuts it in half, the result is a 10-volt pp signal or "V_{pp}". This must then be further converted to "V_{rms}" (by multiplying it by the square root of 2 or 0.7071), which now truly represents 1 watt and can be used for conventional power conversions. Therefore the 7.071-volts DC that remains is what actually corresponds to 1 watt (across 50 ohms) and that is what the meter is reading. Note that we did not include the forward diode voltage drop (about 0.25 volts) at this point as it's low enough to ignore for now.

When you calibrate the meter to read full scale, it will actually be displaying 7.071 volts, which you have adjusted to "100" on the meter with the calibration control so the meter reads 1 watt (but without the diode drop which we ignored). So far, so good. Now, however, let's see what happens when the input power decreases to, say, a quarter watt. The V_{rms} value also decreases, as does the meter reading. The V_{rms} reading for quarter watt is about 3.54 volts, so you would assume that the meter would read a quarter of the scale, but it doesn't.

Why?

Because in both cases we ignored the forward voltage of the diode. As the input power gets lower and lower, the forward voltage drop of the diode becomes a more and more significant factor in the DC reading and the accuracy of the meter gets worse and worse, so at lower power levels, the diode drop really has to be considered. As you lower the value of your DC calibrating voltage (V_{rms}), you will see the error caused by this and how this affects the readings. Therefore, if you need more exact readings, you should always calculate the actual V_{rms} voltage at the specific power level you are interested in and then readjust the meter reading accordingly (including the diode drop). My sincere apologies to those who have (or intend to) question all of this. Now on to the rest of the column.

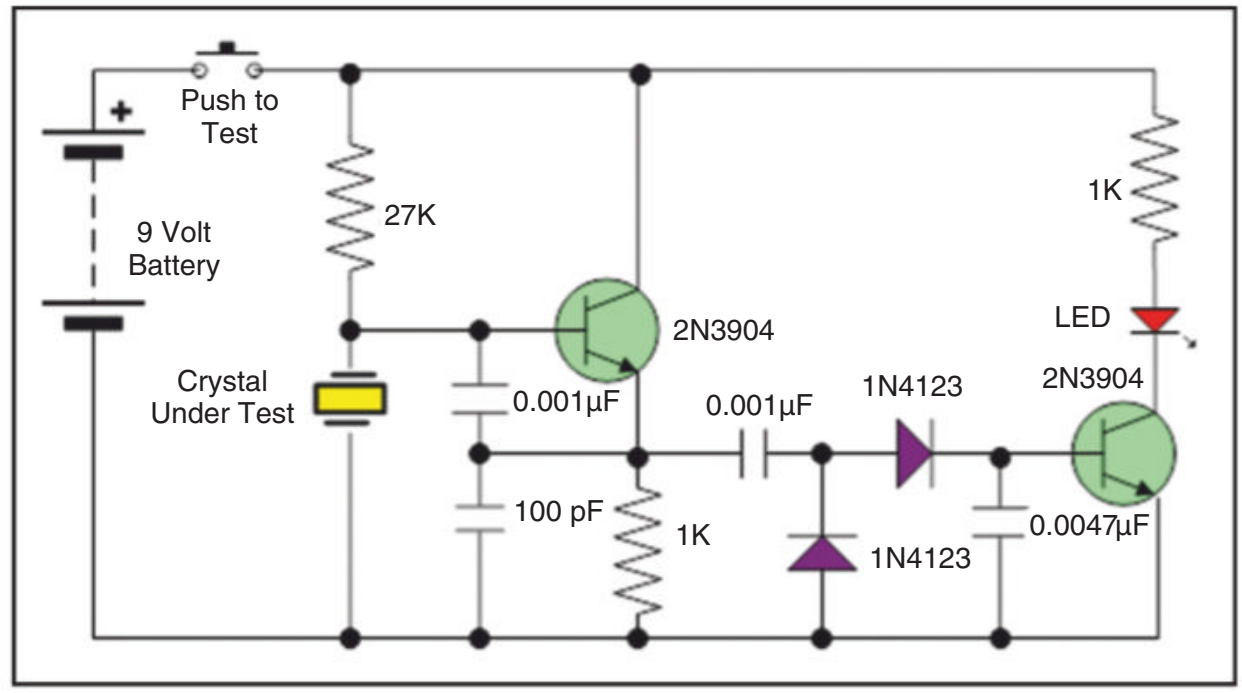

Figure 1. Quartz crystal tester

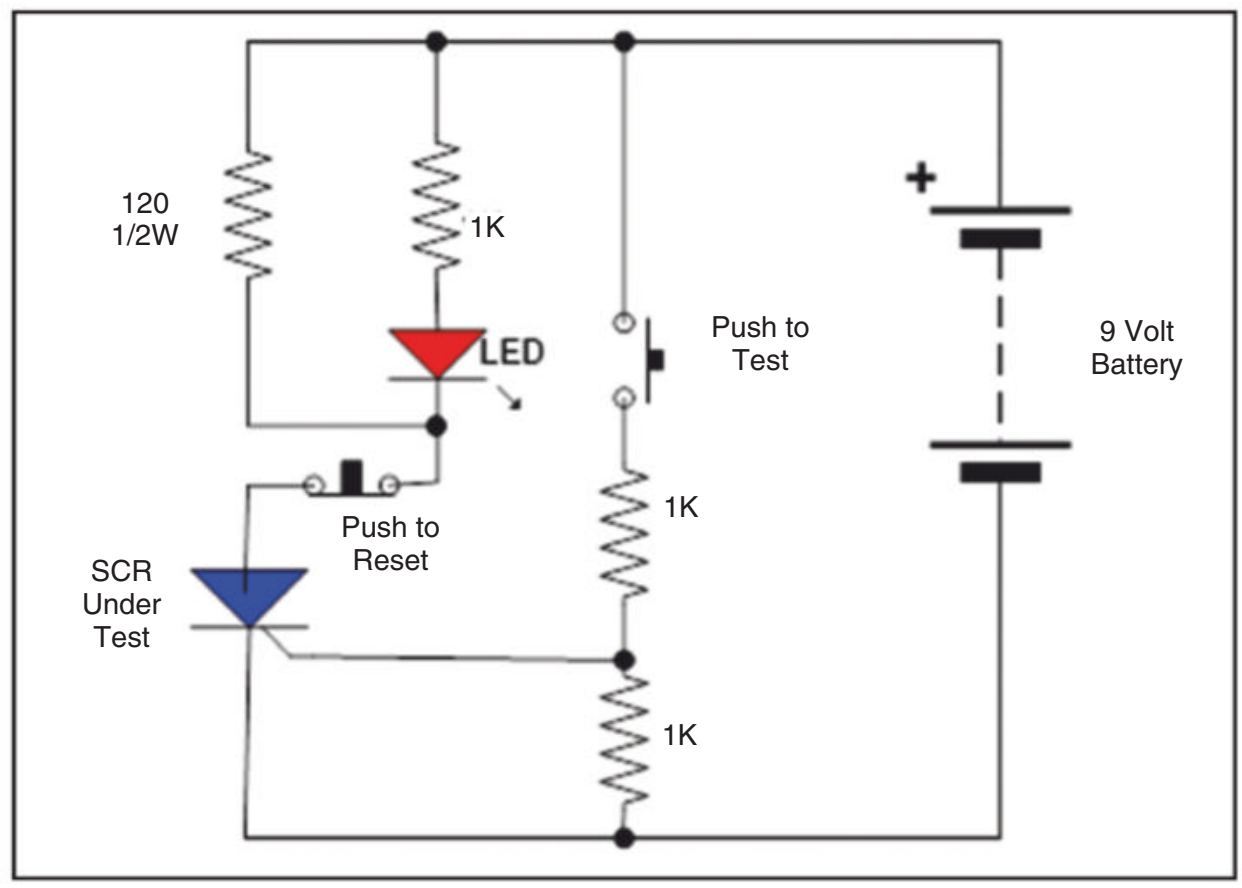

Figure 2. SCR / Triac tester

Crystal Tester

First, *Figure 1* is a simple crystal tester for those "old timers" and QRP operators who still use them. I remember that, in the past, there were literally bins full of these crystals in the surplus houses I frequented in New York City. In those days, Novices were required to be crystal-controlled and with the modification of surplus WWII transmitters and receivers that were popular at the time, these were what was used.

As you can see, the circuit is basically an untuned Colpitts oscillator that oscillates at the frequency of the crys-

*c/o CQ magazine

tal being tested. It will work with most quartz crystals from around 1 MHz to as high as 30 MHz or so. The RF produced in the emitter circuit of the actual oscillator stage is then rectified by a diode doubler, which then drives a second transistor that will turn on an LED to indicate that the crystal is working. If you happen to have a frequency counter with a high impedance probe available, you can also check the actual frequency of the crystal by measuring it across the 1K emitter resistor of the oscillator. Power is from a 9-volt battery and the push-button assures long battery life. Although the transistors and diodes labeled on the schematic are commonly available, they are not too critical and similar equivalents may be used. However, you may have to change the bias resistor in the oscillator.

Figure 2 shows a tester that is normally not too common. It is used to test SCRs (silicon-controlled rectifiers) or Triacs and will be useful for those working with these devices. This circuit tests a device by actually switching it to light an LED.

In operation, the device to be tested is connected as shown and if it is OK, the LED will not light at first. When the push-to-test button is pressed, however, the voltage applied to the gate will trigger (and latch) the device and the LED will go on and once lit, it will stay on. When the push-to-reset button is pressed, the voltage to the device will be interrupted and the LED will turn off. If these actions occur, then the device is OK. However, if the LED comes on when the SCR or Triac is first connected, before the push-to-test test button is pressed, then it is shorted and defective. Since operation of this tester is with a 9-volt battery, when the SCR or Triac is conducting, approximately 100 ma will be drawn from the battery so do not keep it on for too long or the battery life will suffer. When the LED is off, however, there will be no significant drain. Note that this tester will require a minimum so-called "holding current" to operate properly in this circuit, but it should be fine for the popular C106 and equivalent series devices.

I hope these two testers will be of interest to some. In the future, I will try to come up with additional devices of this type that may interest you. I also appreciate the kind comments sent by the experimenters in our midst who used some of the test equipment I have presented in the past.

– Regards, Irwin, WA2NDM

emergency communications

BY JOHN FERGUSON,* K3PFW

My (New) Station

The QTH here has been undergoing renovation for the last two-plus years. Finally, in the last months we have been able to get some of the "pretty work" done to please the XYL, and now I get to start on the rehab / rebuild of my station. This will be the third iteration of the process over the 30-plus years that I've lived here, and I'm incorporating some lessons learned from the previous efforts. The rebuilds to date have been cumulative, building on what was there before. Three additional antennas are being contemplated for this rebuild, and a possible larger antenna project in six months or so. Other than those items, no major changes or additions are planned. In keeping with my desire to cause you, the readers, to think a bit; I'm going to use the opportunity of rebuilding the station to drag you along and share my decision-making process. Maybe some of the issues here will help you make your own decisions down the road as you work through building your station.

First and foremost, this column is about emergency and disaster communication and if your station cannot be safely operated under most weather conditions, you're probably not going to be much help during weather-related disasters. But you say, "oh, but I have to disconnect my antennas during a thunderstorm."

No, you don't!

If you have proper grounding and surge protection and install it correctly, you should be able to safely operate under all but the most severe weather conditions. Do you think that public safety agencies, law enforcement, and the military stop operating during nasty weather? Again, with proper design and installation, safe operating will prevail. The ARRL publishes an excellent book, *Grounding and Bonding for the Amateur Radio Operator*, which is available through its bookstore <https://tinyurl.com/4sd9j5n3>. Common sense on your part must prevail, however. It is you and you alone who is ultimately responsible for your safety, and the safety of those around you.

Starting Outside

The process of rehabbing my station started with a survey and inspection of the external parts of the station: Antennas, tower, pole, feedlines, etc. I listed all the items I looked at, with a brief note as to the condition of each and whether a repair or replacement was necessary. The list was relatively short for replacement, and only a couple of items needed repair. Then, I did a careful inspection of the external grounding, where some issues were noted. There was definitely some "wear and tear" from Mother Nature. Then, Bill Saunders, N3ID, came by with his net-

Photo A. Former windmill tower. All joints bolted like a large erector set. (All photos by K3PFW)

Email:
<K3PFW@cq-amateur-radio.com>

work analyzer and we checked antennas and feedlines. I was pleasantly surprised that there were few issues. The analyzer showed that all the antennas were resonant about where they should be. The testing was done at the output end of the surge protectors, which kept the outside of the coax grounded. We found that if we were checking from the end of the feedline to the antenna, particularly the wire antennas, our hand capacitance and movement of the feedline caused changes in the displayed data of the analyzer.

Then onto the physical inspection of the surge protection for the feedlines, which checked out OK. All installations will require periodic maintenance. Unfortunately, I have not been as diligent as I should have been over the last several years. Although nothing major or unsafe was found, given a few more years, that might not have been the case. When was the last time you gave the external part of your station a careful and thorough inspection? This is something you shouldn't put off.

The primary feature of the antenna farm is a former 80-foot windmill tower with a nice high-frequency (HF) tri-band beam. Twenty feet of 2-inch pipe out of the rotor supports the beam and a commercial 2-meter antenna that's at an elevation of 100 feet (*Photo A*). Each leg of the tower is tied to a 10-foot ground rod where some issues were found during the inspection, probably the result of overzealous yard mowing, and will be reworked. Reworking the beam and 2-meter antenna on the tower will be left to a contractor. Climbing, let alone working after I get up there, is not currently something I want to consider.

At the base of the tower is an enclosure that provides protection for connections between the coax from the antennas and the coax to the station. These cables run underground through conduit to the surge protection enclosure (*Photo C*) on the wall of the house outside the room where the shack is. Breaking feedlines at the base of the tower allows for testing to isolate where issues might be and is certainly a help when working on the antennas themselves. You might think running your feedlines, control lines, etc., through conduit is overkill. After all, there's coax rated for direct burial, isn't there? My philosophy is to dig once and add an extra empty conduit to the run. Conduit is cheap compared to labor and equipment rental, even if you are doing it yourself. Replacement when needed is quick and easy. Expansion of facilities is a snap.

There is also a 32-foot pole with a pipe extension, done somewhat like a ship's mast (*Photo B*), that supports one end of an OCF (off-center-fed) dipole at 50 feet; the other end is supported by the tower. A tri-band U/VHF vertical adorns the top. The "conduit" from the pole to the surge protection enclosure is 1-inch vinyl pipe. It's cheap and easy to work with. A B&W folded dipole (all band) is hung at approximately 30 feet between trees behind the house.

From the surge protection enclosure, jumpers are run to the antenna patch panel in the closet adjacent to the station (*Photo D*). Just back from its trip to the shop for refurbishing, labels will be added to identify the antennas. Jumpers to the individual pieces of equipment will go through the wall, with a nice cover plate for the hole, and into the concealed wiring trough of the station desk. A clean, neat, and uncluttered look gets points from the XYL. The closet, after all, is where she stores her office supplies.

The desk is also homebrew; the material was an anniversary gift when the second station was being assembled. Existing equipment will be added as it is cleaned and checked out in the shop. I'm taking this rebuild step by step, one level at a time, trying to avoid mistakes and oversights.

SPURIOUS SIGNALS

By Jason Togyer W3MCK
www.jaythurbershow.com

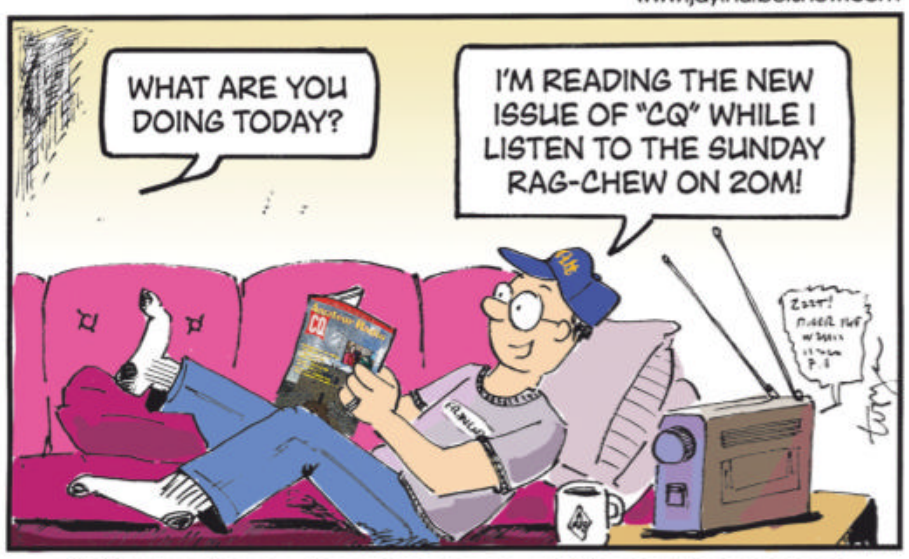

Photo B. Pole and extension with "backstays" like a ship mast.

Surge protection on feedlines and attention to grounding has been a major consideration here from rebuild two. Note I say "surge protection," not "lightning arrestor." Lightning, the visible bolt that we see, is an ionized column of air, literally a conductor, with thousands of amperes flowing through it. Current flow produces magnetic lines of force around the "conductor" which propagate outward. Lines of magnetic force cutting across a conductor induce a voltage proportional to the strength of the magnetic field. Your antenna, wire, beam, vertical, etc., can have enough voltage induced to cause arcing from the center conductor to the shell of a PL-259, or SO-239, the common male and female coax connectors we use. So, do you really want to disconnect your coax and lay it on the floor? Better you throw it out of the window. I have seen unterminated connectors on antenna patch panels flash over during lightning storms. It's both fascinating and scary. Again, the ARRL's *Grounding and Bonding for the Amateur Radio Operator* is an excellent starting point for learning how to ground your station. You will be well advised to read that first.

How Will You Use Your Station?

Once you put together your station, what are you going to do with it? What is your style of operating? Do you need to monitor multiple frequencies at the same time, or is a simple one-antenna, one-transceiver setup more your style. Operating

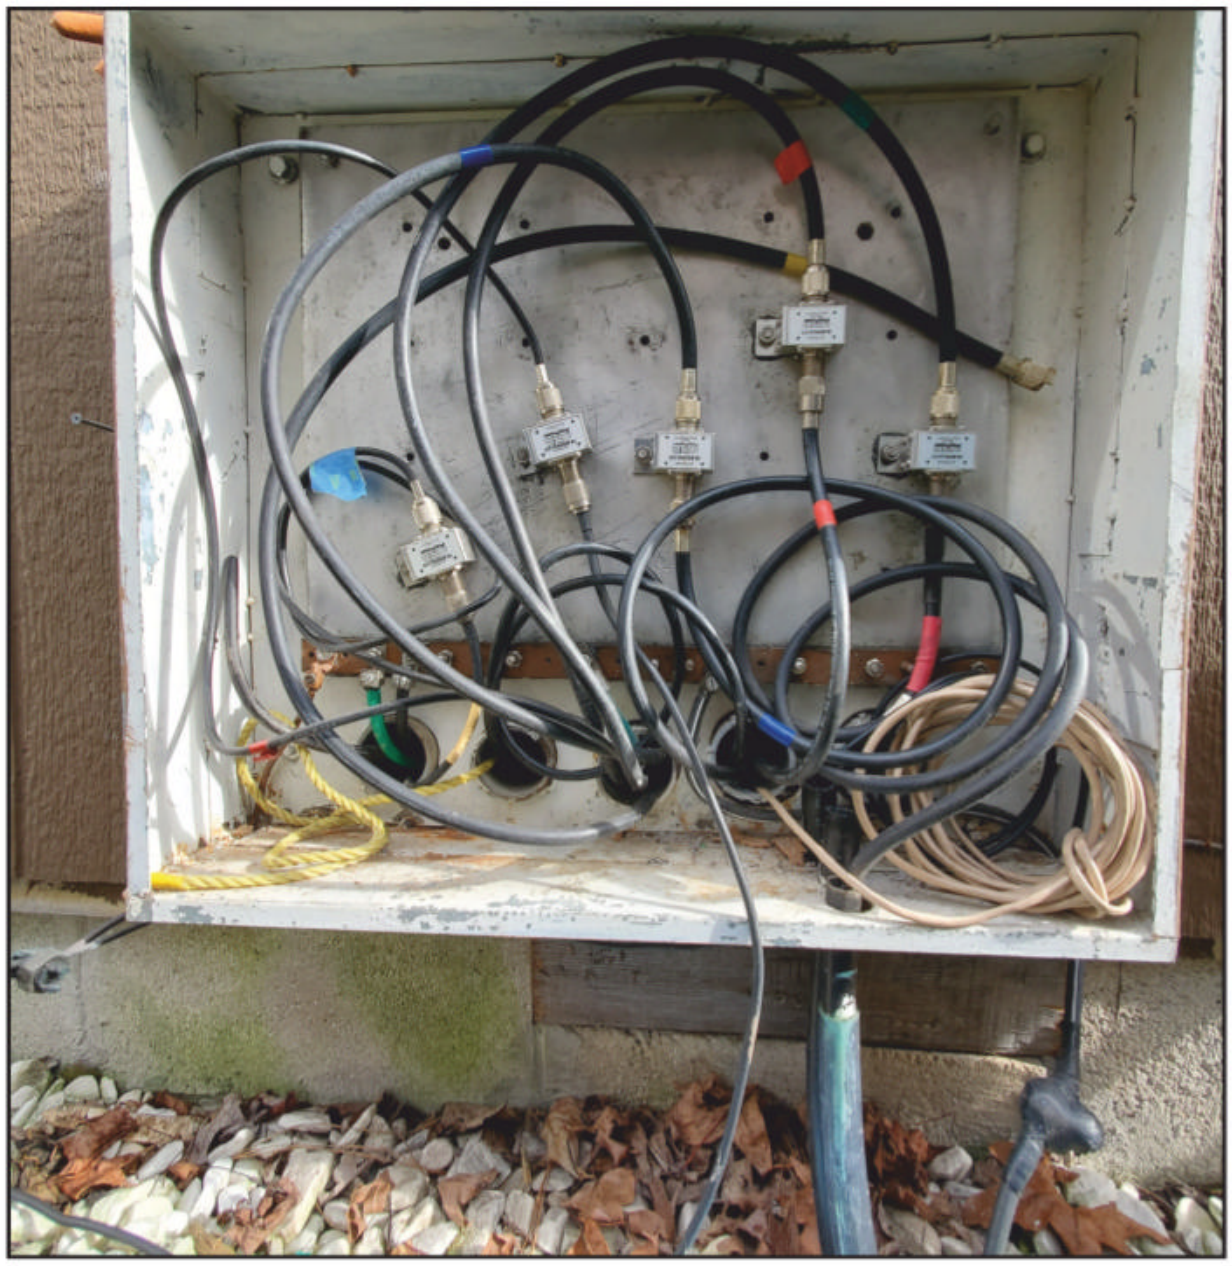

Photo C. Surge protection panel with cover removed.

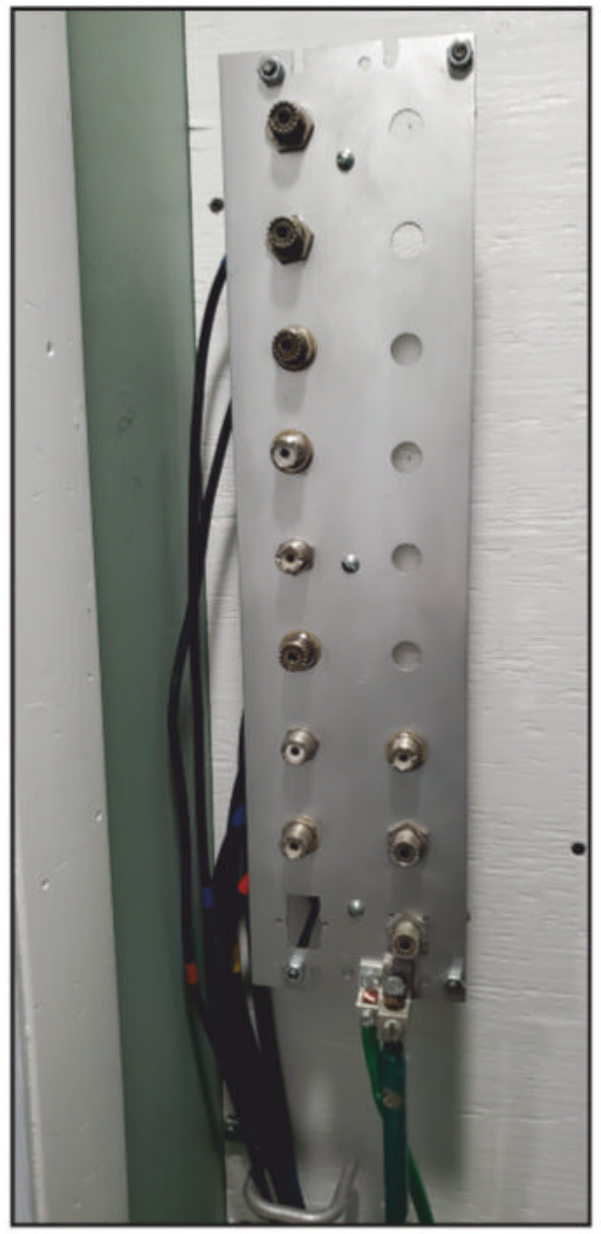

Photo D. Antenna patch panel makes swapping antennas and rigs easy.

under disaster conditions puts an added strain on you, the operator. Think about what would make things easier for you. Comfortable placement of equipment will reduce fatigue.

Considering what I do, what I like to do, and what I've learned about operating from the home QTH led to the comment at the beginning of this article of adding more antennas. Three new antennas are being considered. Number one is an inverted-L for 160 meters, which is a band I have wanted to get back onto for a while. The inverted-L design is the most cost-effective way to get on 160 meters as it's relatively simple to make, and will fit on smaller real estate. A weatherproof "auto tuner" at the feed point makes matching "automatic" and will allow use on other bands, too. The inverted-L will replace the missing doublet that formerly ran from the top of the pipe extension on the pole to a tree on the other edge of the property. That will return to what was the original design, the two "backstays" balancing two antennas running in the opposite direction, providing a more robust structure, with a symmetrical support. Also, there is some interesting work on using groundwave for digital to link emergency operations facilities. This will provide a test antenna for trying that.

Number two will be a low-gain, dual-band vertical placed not too high for local repeater use. There are at least seven repeaters within 16 miles of the QTH. Being in Delaware, coastal ducting is a fact of life; fine if you want to talk to Connecticut with your handheld (HT) and a rubber duck antenna. I'm trying to reduce incoming interference, and not interfere with distant repeaters. The low height of the dual-band VHF antenna will put it at approximately 6 feet, sort of like a mobile in your side yard.

Number three will be a magnetic receiving loop to try and beat the increasing noise floor we live in with our modern society. The ability of this type of antenna to reject manmade noise is incredible. We installed one about two years ago at WS3EOC, the amateur radio station at the Sussex County Emergency Operations Center. Signals nearly unreadable on the transmitting antenna were "Q5" on the loop. Most of the noise comes from the multitude of energy-efficient outdoor lighting at that location.

Power for the station equipment will be provided by a modest 20-amp DC supply through a West Mountain PWRgate, which maintains the charge on two 100-amp-hour sealed lead-acid batteries, immediately switching over on a power failure. I'm old school and lead-acid technology is a bit more forgiving of mistreatment than lithium products. Weight in this situation is not a concern. The batteries are housed in polyethylene battery boxes for safety, both accidental contact with exposed terminals and acid spills, which shouldn't occur, but if they do, will be contained within the boxes. This is the same system that was used in the previous rebuild of the station. The 20-amp supply is sufficient as this is a single-operator station. The 600-watt linear amplifier will be line powered.

I'm looking forward to getting back on the air; it's been a while. Progress is important. It takes time, effort, and resources, but in the end, there is a better and safer station for you that enhances your operating style.

I also look forward to the questions and comments you, the readers, send in. Use the K3PFW email address at the bottom of the first page of the article.

kit building

BY JOE EISENBERG,* K0NEB

Ham Radio Solutions CW Hotline: A March Forward

When learning Morse code, the most common tools used are a simple code practice oscillator and a straight key. In these pages I have shown many of these, from very simple kits such as the Four State QRP Group SSCPO kit up to the very complex Morserino32. This time we take a look at a simple code practice kit to build that offers some interesting features.

The Ham Radio Solutions CW Hotline is a code practice kit that allows the builder to choose between a built-in straight key or a paddle. The CW Hotline also gives the option of plugging in a straight key or paddle so it leaves the door open to using either type of key. There are also outputs that connect to an external audio amplifier, which is helpful in teaching code classes, as well as a keying output. The keying output allows this kit to key most solid-state CW rigs.

What makes this kit even more interesting is that it has networking capabilities. The CW Hotline can connect to another CW Hotline on the same Wi-Fi network using its built-in Wi-Fi and has the capability of participating in one-on-one or group code practice via the web. The CW Hotline is powered by normal 5-volts DC USB power, which can be supplied by most inexpensive USB cellphone chargers or USB power banks. The supplied cable plugs into the USB Micro jack on the back. It allows two different Wi-Fi configurations to be set in it to allow, for example, connection to your home Wi-Fi network, or your cell phone's Wi-Fi "tethering" function.

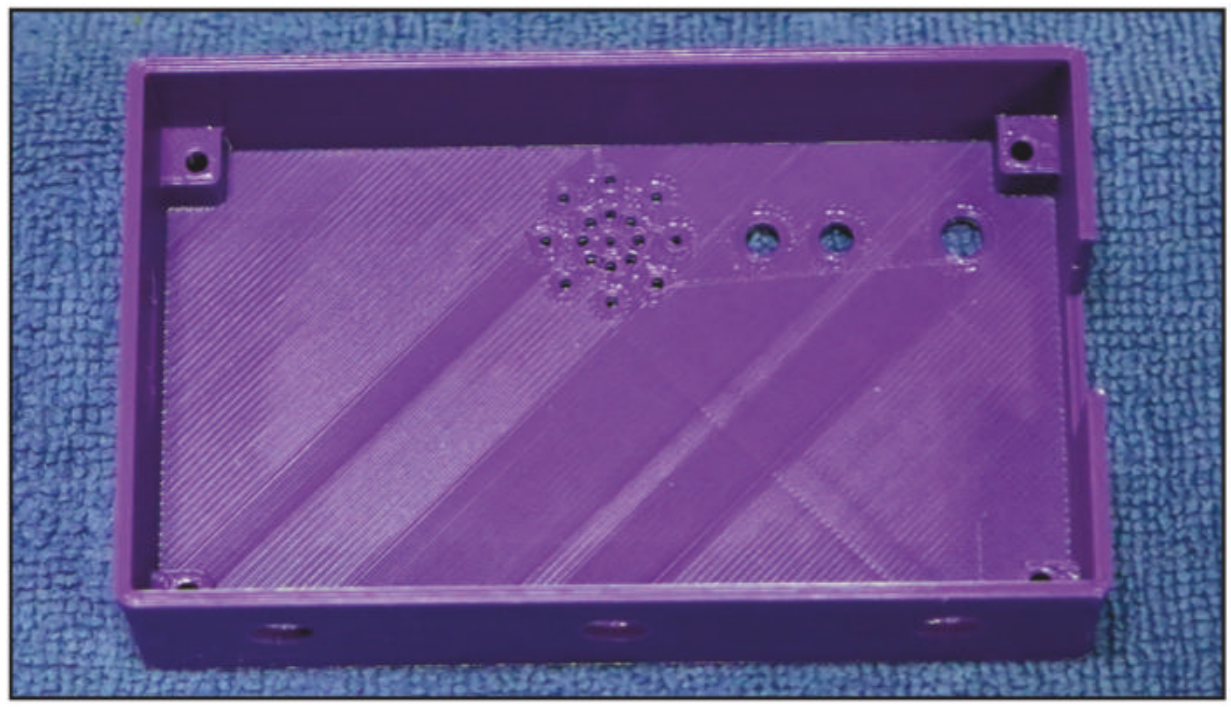
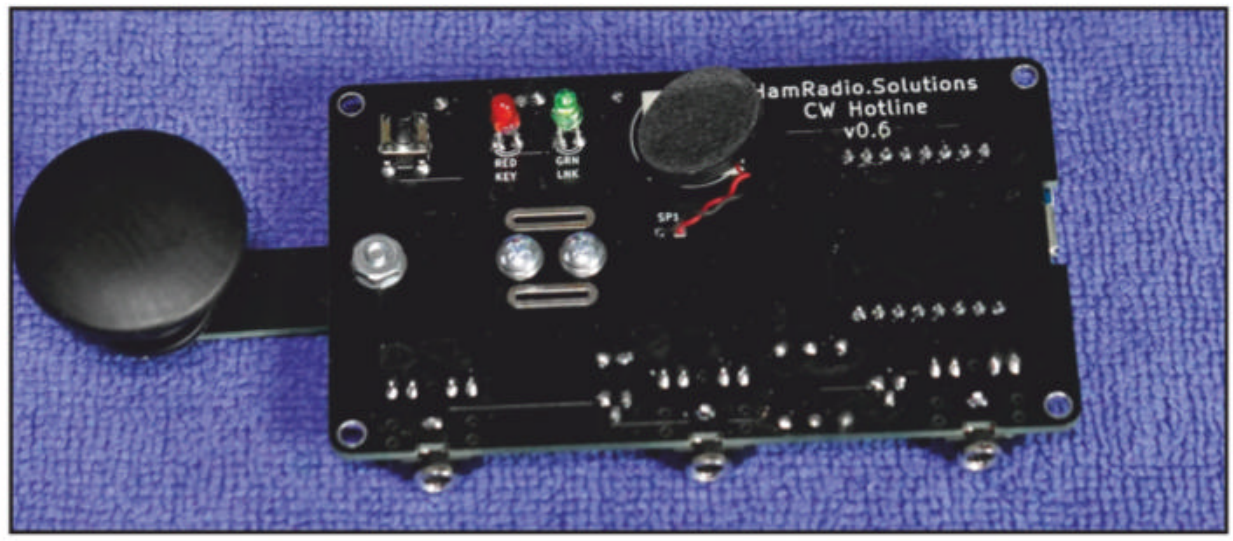
with the three jacks is to simply to solder the center pin of the jack on each one. Then, using a finger underneath a jack, I reheat that center pin while pressing on the jack until I feel it settle into place flush with the PC board. Once I am satisfied that each jack is flush with the board, I solder the remaining four back pins on each jack. It is very important to be sure that the jacks are flush so that the case fits properly.

Care must also be taken when soldering the rows of pins that connect to the Wi-Fi board to ensure that they are all perpendicular to the main board. There are many methods to achieve this. One method that I have seen success with is to solder just one pin on each, then reheat it while holding any unheated pins and moving it until it is straight. Once both rows of pins are straight, you can test it by placing the Wi-Fi board over the pins to see if it fits correctly. It is a lot easier to make position adjustments at that point than it is after all the pins are soldered. Some have had success using a small solderless protoboard placed over the pins and pressed onto them to hold them straight and parallel.

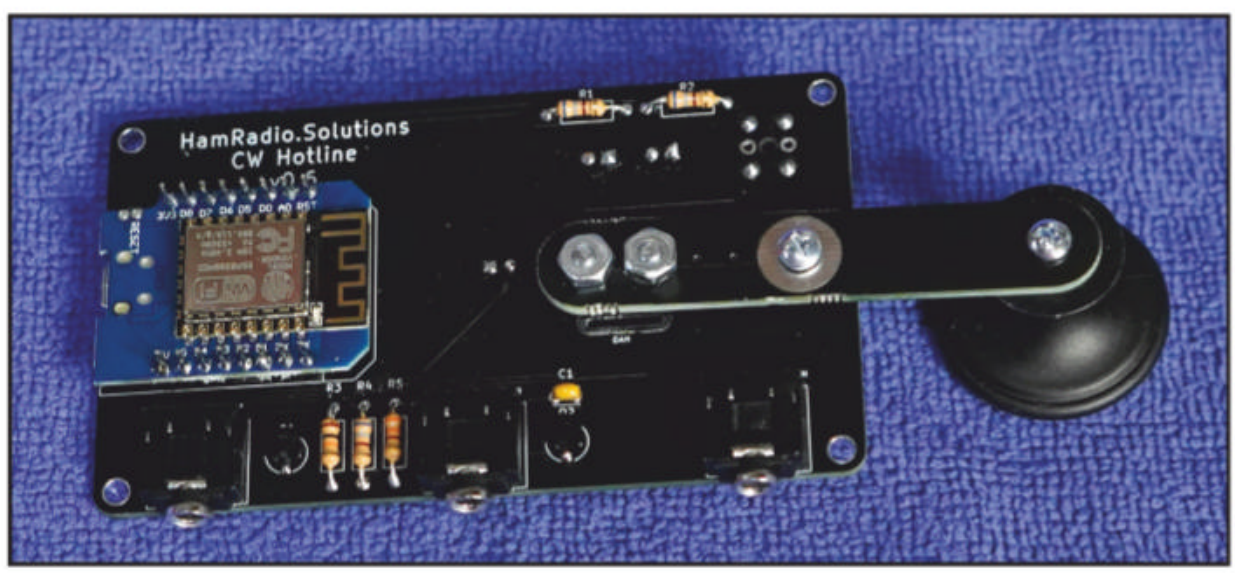
The included plastic case requires careful drilling, using a PDF file template that can be downloaded, printed, and taped to the plastic case. There is another option for the case, and that is to 3-D print a case using the STL files linked to on the web page of the CW Hotline kit. I used the W7HLO design, with which — if the case is printed exactly to size — the snap-on lid for the bottom of the black supplied case fits perfectly on the bottom of the completed 3-D printed case. The result is a case in which the holes fit exactly and the



The 3-D printed main part of the case fits exactly the same as the supplied case, without having to drill any holes. There is an option to print either with or without the opening for the key / paddles. The built-in keying choices are optional with any key or paddle being also able to plug into the CW Hotline directly.



The top of the finished CW hotline includes the two status LEDs as well as the control button.



The bottom of the board holds the jacks as well and most of the other components, including the pre-assembled Wi-Fi board.

The finished CW Hotline in the 3-D printed case is assembled with the straight key option. A paddle still can be plugged in to the kit as well.

case fits the kit. The kit comes with a front panel label sticker that can be used with either the supplied case or a 3-D printed one.

Configuration

Once completed, the configuration of the kit is done by connecting it directly to a computer via USB and then going to the CW Hotline web page and following the steps in the operation manual. Configuration consists of setting the parameters, including the Wi-Fi access, by filling in blanks on the web page. Once completed, you can save those to your kit. Each kit comes with its own passcode that gives access to the website. Do not lose this code. It is on a sticker in the box as well as inside the case. The website also allows you to join different channels to talk with others using CW. An interesting feature of the CW Hotline is the ability to use a second kit to connect to the CW key input of your rig and remotely key your radio. This is a very important reason to not divulge the passcode that is supplied with your kit as it also provides security for your remote keying option.

You can order the CW Hotline kit for $55 including USA shipping from Ham Radio Solutions at <https://hamradio.solutions>. The Super Simple CPO kit mentioned in the beginning of this column is available from the Four State QRP Group at <www.4sqrp.com>. The Morserino32 is also still available at <www.morserino.info>.

With hamfest season getting under way, it is time to remember to register for Ozarkcon to be held in Branson, Missouri, on March 31/April 1st. Ozarkcon is put on by the Four State QRP Group. There will be a live kit-building experience at which we will be assembling the Four States QRP surface-mount dummy load kit. We will offer both the solder paste and direct soldering methods of dealing with the surface-mount parts. I also plan on attending the Green Country Hamfest in Claremore, Oklahoma; the Shriners Hambash in Kansas City, and the International DX Convention in Visalia, California for my very first time. All of these events are in April.

– Until next time, 73 de KØNEB

the ham notebook

TEXT AND PHOTOS BY WAYNE YOSHIDA*, KH6WZ

Let's Get Back to Normal

Photo A. CES® is one of the most interesting and exciting tradeshows and conventions for consumer electronics technology. (Courtesy of Consumer Technology Association)

As I write this installment of "The Ham Notebook," I am hunkered down in my home office trying to keep warm and hoping my shingled roof stays in place. It is windy and raining outside. We do need the rain since most of the southwest U.S. has been in a severe drought for the last several years.

My day-job company continues its temporary COVID-inspired, hybrid work-from-home / work-from-office policy to minimize contact and yet increase collaboration by meeting in person on certain days. If this sounds a bit strange, I agree. But I suppose it is better to be safe than sorry.

We are beginning to slowly get back to allowing local (no international) business travel, so this is a good sign of things getting back to normal.

My mind is wandering, as I think about my recent business trip to CES® 2023 in Las Vegas (*Photo A*). The Consumer Electronic Show is said to be "… the most influential tech event in the world — the proving ground for breakthrough technologies and global innovators." Too bad there are no ham radio displays at CES.

But I did have booth duty showcasing my day job's company's parts (*Photo B*). And yes, some ham radio transceivers use parts from the company I work for.

Meanwhile, when I finally had some time to walk around the exhibits, I noticed some very interesting things as well as some things that I thought were almost totally useless, and I often asked myself, "why would anyone want something like that?" several times.

In addition to the latest products for home entertainment electronics, computing, computer networking, gaming, and eSports, there were plenty of other places where "electronics" entered into places previously not known for electronics applications.

I recall CES when the "next greatest thing" was computer gaming. Multiple buildings (not booths) were devoted to one company's video games.

This seems to have shifted, and the big thing at CES this year was artificial intelligence (AI) and autonomous vehicles. Those products reminded me of many science fiction

email: <kh6wz@cq-amateur-radio.com>
Linkedin: www.linkedin.com/in/wayneTyoshida

Photo B. An interactive display showing various RF, switching, and timing components for hybrid and electric vehicles at CES. (Photos B-O by KH6WZ)

Photo D. The Lightyear solar car has a range of over 620 miles between charges. It is in production and available in Europe. The car on display is not a protype or concept vehicle. It is a customer's car, on loan for the show.

Photo C. A robot cat available from a company called Elephant Robotics. No need to feed it or clean the litter box. But it is too strange for me.

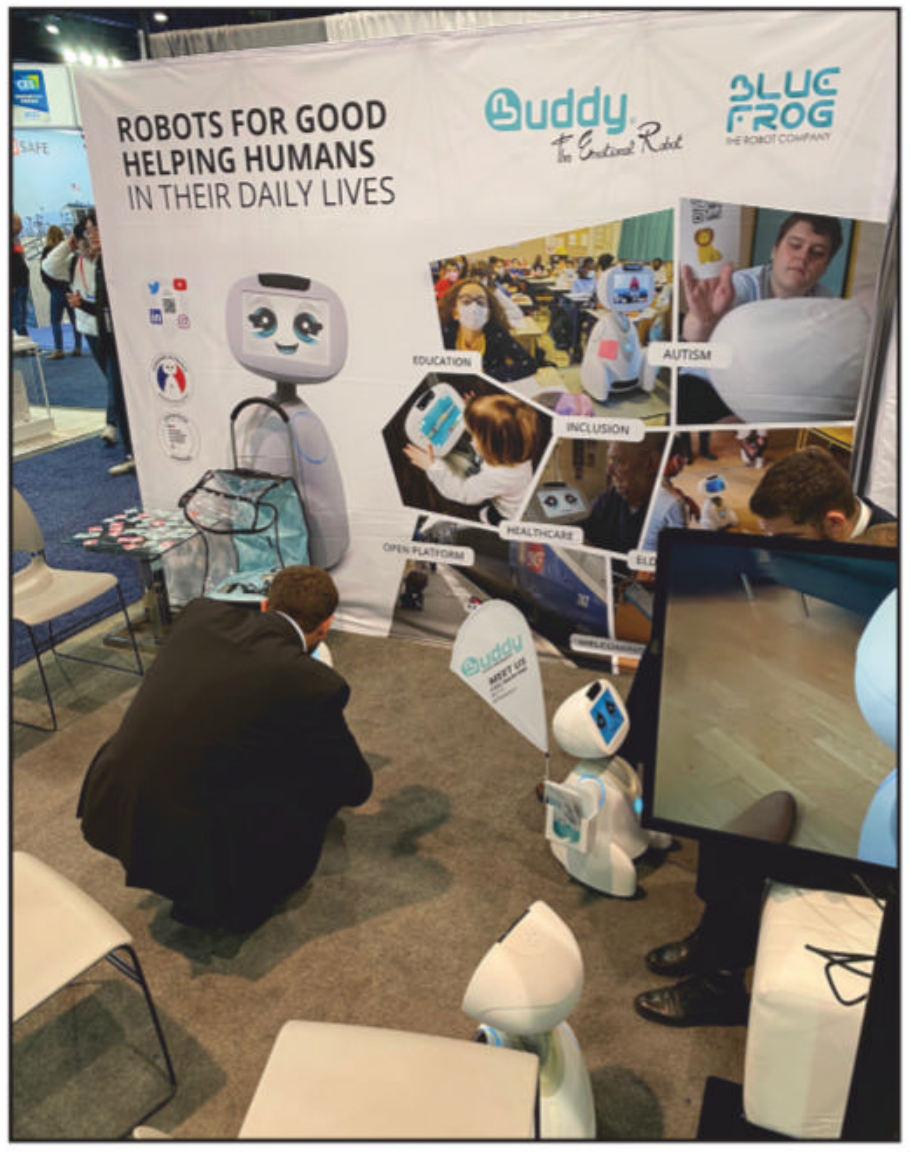


Photo E. "Buddy, the Emotional Robot" is deployed in thousands of schools in France. It is an "emotional AI companion" from Blue Frog Robotics.

Photo F. One of the Indy Autonomous Challenge race cars. Looks just like an "ordinary" race car, but if you look closely, there is no driver seat (see sidebar for more).

Photo G. If you go to your local ham radio convention, you will be tempted to open your wallet and spend some money on something.

Photo H. All ham conventions are great places to socialize with other human beings with similar interests.

Photo I. If you time things right, you might be lucky enough to see some live, on-the-air demonstrations, like this one in which Clint Bradford, K6LCS, shows everyone how easy it is to make satellite contacts.

stories and movies, and a "Twilight Zone" episode or two, like the 1959 episode called "The Brain Center at Whipple's," in which machines replaced humans in a manufacturing plant. You can see some of these items in *Photos C*, *D*, *E*, and *F*.

Back on track for this column, and blending the CES experience with ham radio products, I am glad there is not too much "glitz" and "useless gadgetry" in the products we use to communicate.

"Our" Conventions and Trade Shows

For ham radio equipment, our biggest shows include the Dayton Hamvention® in the U.S., the JAIA Ham Fair in Japan, and *Friedrichshafen* International Amateur Radio Exhibition in Germany.

There are a ton of ham radio conventions in the U.S., but

Photo J. One of the main reasons I like going to ham radio conventions is the swapmeet aspect. I have found very useful and often difficult to find parts and gadgets over the years.

Photo K. Hands-on learning events, like learn to solder and build-a-thons, are another great feature of many ham radio shows.

Photo L. It is always great to see examples of CQ magazine's history, represented by antique original magazines from the past.

Photo M. Where else can you see a real Collins service van, fully restored and equipped with working vintage Collins gear?

Photo N. One excellent side benefit of going to in-person ham radio events is learning from other hams. Here is an example of this "guerilla technique" as applied to learning new things. Brian Yee, W6BY, was selling some items at a recent radio gathering. Although I did not see anything that interested me, I did notice how he mounted an HF antenna to the back of his Toyota Prius.

here are some of my favorites, in random order: Orlando HamCation, Dayton Hamvention, Ham-Com in Dallas (*Ham-Com is no longer being run. –ed.*), and Pacificon, which is also the ARRL Pacific Division convention. There are many other events that I have heard about and are on my list to go to someday.

These gatherings are excellent ways to meet others, to learn new things and to see the latest products from the equipment manufacturers and dealers. Many events include a swap meet (flea market) so you can participate as a seller as well as a buyer of new and used gear of all kinds. You can see what you are missing in *Photos G-N*.

After over two years of limited travel and human-to-human contact, I am glad to experience the beginnings of getting back to normal. Although I am an introvert by nature and enjoy solitude, I also miss seeing my friends and making new ones, as well as traveling to other places to do things.

I am looking forward to traveling and visiting and learning and doing new things in my ham radio — as well as my other — worlds and personal interests.

– 73, Wayne, KH6WZ

The Indy Autonomous Challenge (IAC)

Although not directly related to ham radio, the Indy Autonomous Challenge (IAC) is a great opportunity for career development for university students around the world. Certainly, ham radio's hands-on experience with electronics and building and integrating hardware can be an asset and possible advantage to any college curriculum.

A primary goal of the IAC is to advance the technology for fully autonomous vehicles and advanced driver-assistance systems (ADAS). The Science, Technology, Engineering and Math (STEM) competition is to program the autonomous-modified racecars and compete in a series of increasingly challenging competitions.

In other words, the competition is not to build a race car, but to program the software to run the vehicle. It looks like an excellent opportunity for students to experience real-world hands-on practice to collaborate, design, and achieve a goal.

Each self-driving vehicle is capable of speeds of over 170 mph and is based on a Dallara AV-21 Indy Lights chassis, equipped with a 2-liter, inline 4-cylinder, turbocharged engine. A small supercomputer occupies the driver cockpit (*Photo O*).

The autonomous system electronics includes the following:

LIDAR: Three sensors to judge distance between other vehicles and obstacles on the track.

RADAR: Three systems used to calculate relative position and speed of other cars and obstacles.

Cameras: Six cameras allow the remote "drivers" to visually see other cars and the track.

GPS: Four systems, with accuracy to 1 or 2 centimeters.

The cars also include various other sensors for real-time feedback on all aspects of the vehicle condition such as tire temperature, engine data, and other telemetry.

The 2023 IAC winner was team PoliMOVE from *Politecnico di Milano* (Italy), and the University of Alabama, reaching maximum speeds of 180 mph, a new racetrack autonomous speed world record.

More information, as well as videos on this unique and exciting opportunity can be found on the IAC website <www.indyautonomouschallenge.com>.

Photo O. The driver cockpit in an Indy Autonomous Challenge (IAC) racecar is filled with electronics. There is no room (nor need) for a human driver.

gordo's short circuits

BY GORDON WEST, * WB6NOA

Two HF Tuner Considerations

Comet / NCG CAT-300 and LDG Z-100A

For those high-frequency operators looking for increased compact manual antenna tuner performance, I tested the new Comet / NCG Company CAT-300 manual tuner, with great success.

Increased RF output performance is achieved from a slightly larger internal inductance coil, along with large(er) high(er) quality variable capacitors. The Comet CAT-300 can easily handle up to 300 watts, once you tune it up at a more reasonable level, like 50 watts. Don't tune on high power CW and rotate the inductance click-click switch on *any* manual tuner. This could arc the coil contacts.

First tune up on RECEIVE! Yes, *listen* for your rig's background band noise to increase at resonance.

Step one is to set the inductance switch to the band you wish to tune, again listening for your transceiver's background noise to slightly increase. Now quickly rotate both TR and X variable capacitor knobs for maximum receiver noise, and work them back and forth rapidly to get the most white noise possible. This puts you close to resonance. All this done on receive.

Then, find a nearby clear frequency, give your callsign on transmit SSB, and say "FOOOUUUUURRRRRR" while watching the SWR needle to take a big dip, and power output needle jump up, as you final-adjust both capacitor knobs for minimum SWR and max power out. Then, give your callsign, release push-to-talk on the mic, and write down the knob settings for that band. Do each band with this technique that the pros use. Remember, first tune on RECEIVE.

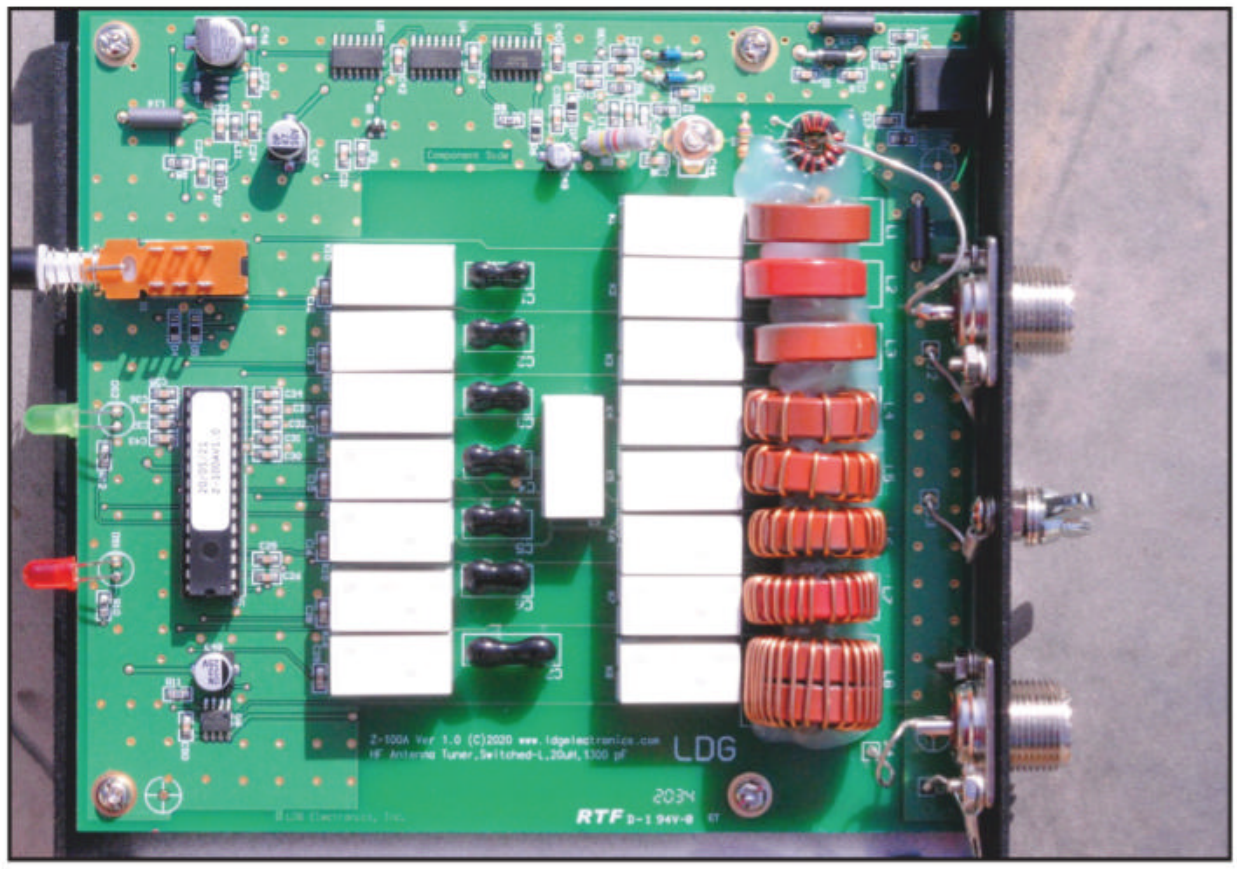
Small tuners this size can handle impedance loads from 10 ohms through 600 ohms, but for me, anything over 4:1 SWR requires more antenna work, even though the tuner can handle this. Any antenna that is so far off resonance will create return currents on the coax braid, and the last thing you want from any manual tuner is returned RF, just inches away from your operating position and smiling face.

You can fool your rig into thinking that a match has been found, but a mismatched antenna can pose an RF hazard in your shack from the coax, with power first going out and up to the antenna, and then reflected energy coming back down to the tuner on the braid of the coax.

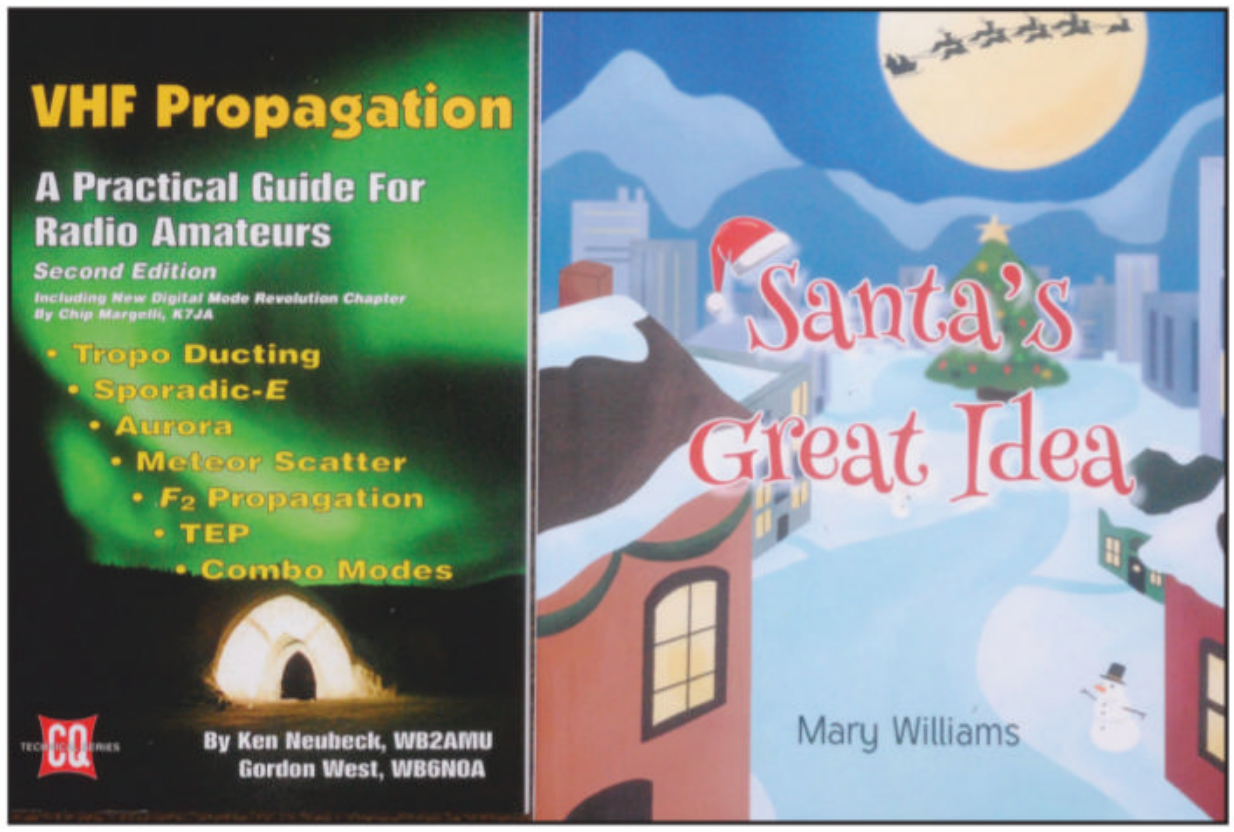
The Comet CAT-300 manual tuner easily tunes from 1.8 to 29.9 MHz and all in between.

The LDG Z-100A has a coax output only to a balanced antenna system..

**CQ Contributing Editor*
2414 College Dr.
Costa Mesa, CA 92626
email: <wb6noa@cq-amateur-radio.com



Self-latching relays keep the LDG tuned with no power needed to keep them set.



Two great books for ham radio operators.

A band selector switch gets you set for 160 through 6 meters, and will easily tune 60 meters and any 5-MHz channel on the 7-MHz band setting; plus my 4-MHz Coast Guard NTIA channels on the 3.8-MHz band setting. So for MARS, CAP, and authorized users of government channels, this tuner can handle it.

The tuner has a large cross needle SWR meter, backlit with LEDs. The meter has a white background seen during the day, with black needles. Easy to see in ambient light, but backlit at night, the background goes to dark grey, with black needles nearly unseen, keeps us guessing what the power and SWR are without a closer look.

The PEP average button gives the operator a good feel for working power output and drive levels for voice and digital operation. It also has a two-position push switch for two different antenna selections for the two antenna jacks on the rear.

For more information, visit <www.natcommgroup.com>. The CAT-300 is about $250 at ham stores.

LDG Autotuner

For automatic tuners, when going mountaintop portable, the LDG Z-100A has a unique function of battery-saving latching relays. This feature minimizes the need to have the automatic tuner constantly ON, drawing current, after you tune up. Once the auto tuner finds resonance, you can drop the 12 volts and the relays stay latched for full power out on your portable rig. Save battery power on the peak.

The Z-100A has a 50-ohm coax cable input and output and tunes dipoles that are not quite resonant for their own perfect match. Off-center-fed 80- through 10-meter dipoles, 10-ohms Z to 400-ohms Z, were easily auto-tuned with a typical tune-up time of 1 or 2 seconds.

But this is not a longwire waterproof reactance-feed tuner for loading up a cactus or a rain gutter. This tuner sits by the portable or home rig, and with the correct rig custom LDG cable kit, tunes up automatically in a flash, great for Summits On The Air ops. But the antenna you are using up on the peak must be "balanced" with a common center feed point — this will help minimize return currents on the coax.

LDG offers its own pre-assembled radio-specific cable kits, with matching plugs for most manufacturers' ham rigs. The Z-100A can also be tuned by a push button on the tuner itself if you have a rig for which LDG doesn't have a matching cable kit.

An SWR LED on the tuner lets you know the tuner has matched the antenna you are tuning.

The tuner will memorize up to 2,000 tune ups, and it can return to a tuned position within milliseconds.

If your SOTA and POTA (Parks On The Air) HF gear does not have a *built-in* tuner, the LDG Z-100A will give you that perfect match! Plus, it's made in the USA.

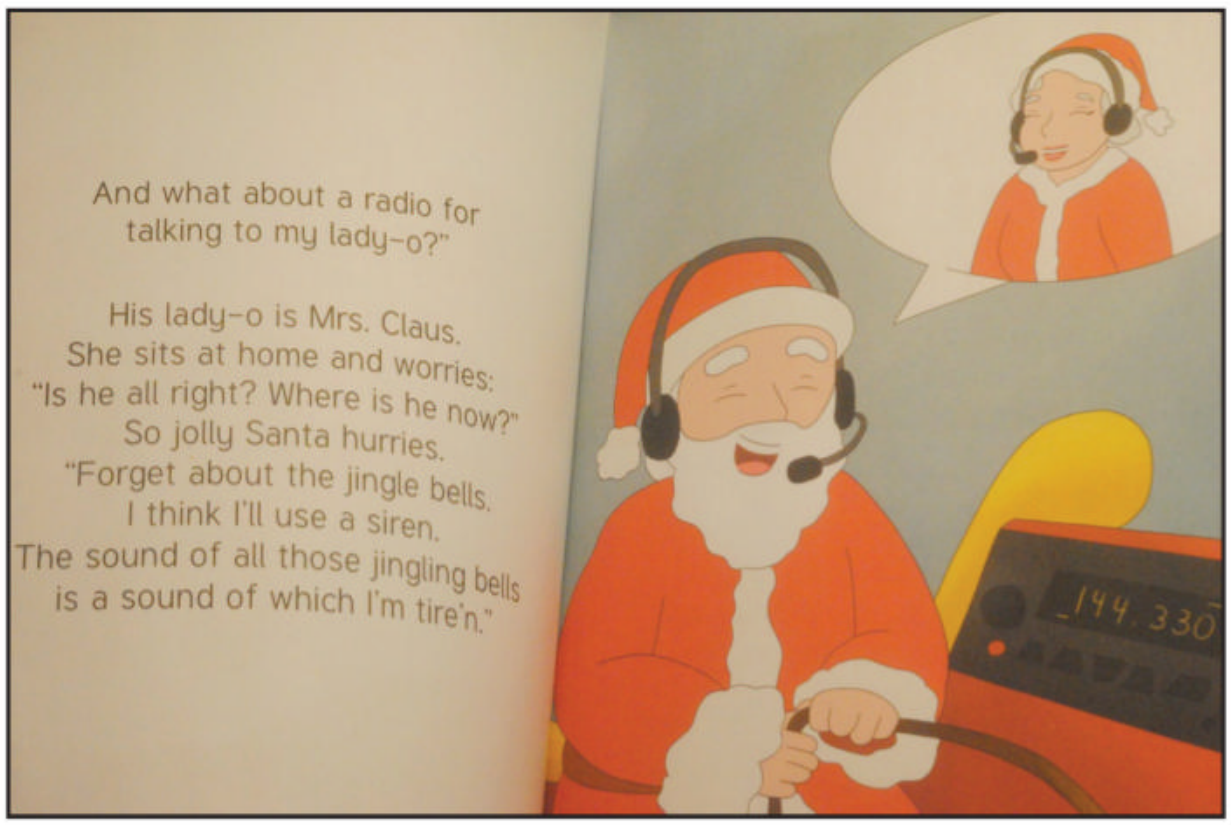
Learn more at <https://ldgelectronics.com>. It retails for $199 at ham dealers.

Second Edition Of Our CQ VHF Propagation Book

Six meter legend Ken Neubeck, WB2AMU, "Mr. 6-Meter Magic Band," has worked up for *CQ* magazine the second edition of our book on VHF / UHF propagation, with my updated chapters on how to work tropospheric ducting, and fun with sporadic-E (E_S).

Ken continues to include charts, graphs, and photos, and his fun writing style leads to a greater understanding on how exactly VHF and UHF radio waves many times go well beyond line of sight! Ken writes with a smile.

Added to our second edition is famed DXer Chip Margelli, K7JA, with a full



A children's book about Santa and his radio.

chapter on working digital modes, like FT8, from 6 meters on up. Who would believe moon bounce reception on a single Yagi on 2 meters would be possible in the Q65 and MSK144 weak signal digital modes? Chip tells all.

Our new book is sized 6- x 9-inches, 148 illustrated pages, and ships direct from the publisher, our own CQ Communications! It's $21.95 plus shipping, phone (516) 681-2922, or visit <www.cq-amateur-radio.com>.

With Solar Cycle 25 looking great for 6-meter skywave as conditions continue to improve, learn some new tricks in working E_S openings, hours before the rest of the local hams know the band is opening. And when 6 meters goes short, jump up to 2 meters, and enjoy short-lived skywave contacts up to 1,000 miles away.

Speaking of books ... If you have very young children who you want to introduce to wireless radio, a child's hardback book shows, in rhyme, how Ham Operator Santa, during this past holiday season, stays on course, giving Rudolph some time off, with an HT and other modern electronics in his sleigh, and comms with Mrs. Claus. But alas, his elves ran down the batteries, so Rudolph gets back in action!

Written by Mary Williams, AB6CZ, it's called *Santa's Great Idea*, at most bookstores, Newman Springs Publishing.

Sea Water Nearby? A Big River Nearby?

Most maritime ship chandleries are ultra knowledgeable on used boating things like cleats, anchors, sailboat masts, sails, engines, switch panels, mooring chains, and generators, but not so tuned in to radio stuff, like long-range marine single-sideband (SSB) radios.

Many mariners throw in the marine electronics and SSB radio with the boat they are selling, and the new owners usually scrap out these big bulky boxes at the navigation station for the more modern satellite communications systems.

Luckily, the crystal-controlled dynamotor tube medium frequency 2- to 4-MHz AM rigs are long gone. Now showing up are these "big clunker" 2 MHz to 29.9 MHz marine radios for pennies on the dollar.

Even though the marine high-frequency radios are pre-channelized for ITU upper-sideband (USB) marine frequencies, they can be front panel switched to the open tuning RX mode for upper *and* lower sideband, from 2 MHz to near 30 MHz, in tuning steps down to 0.1 kHz.

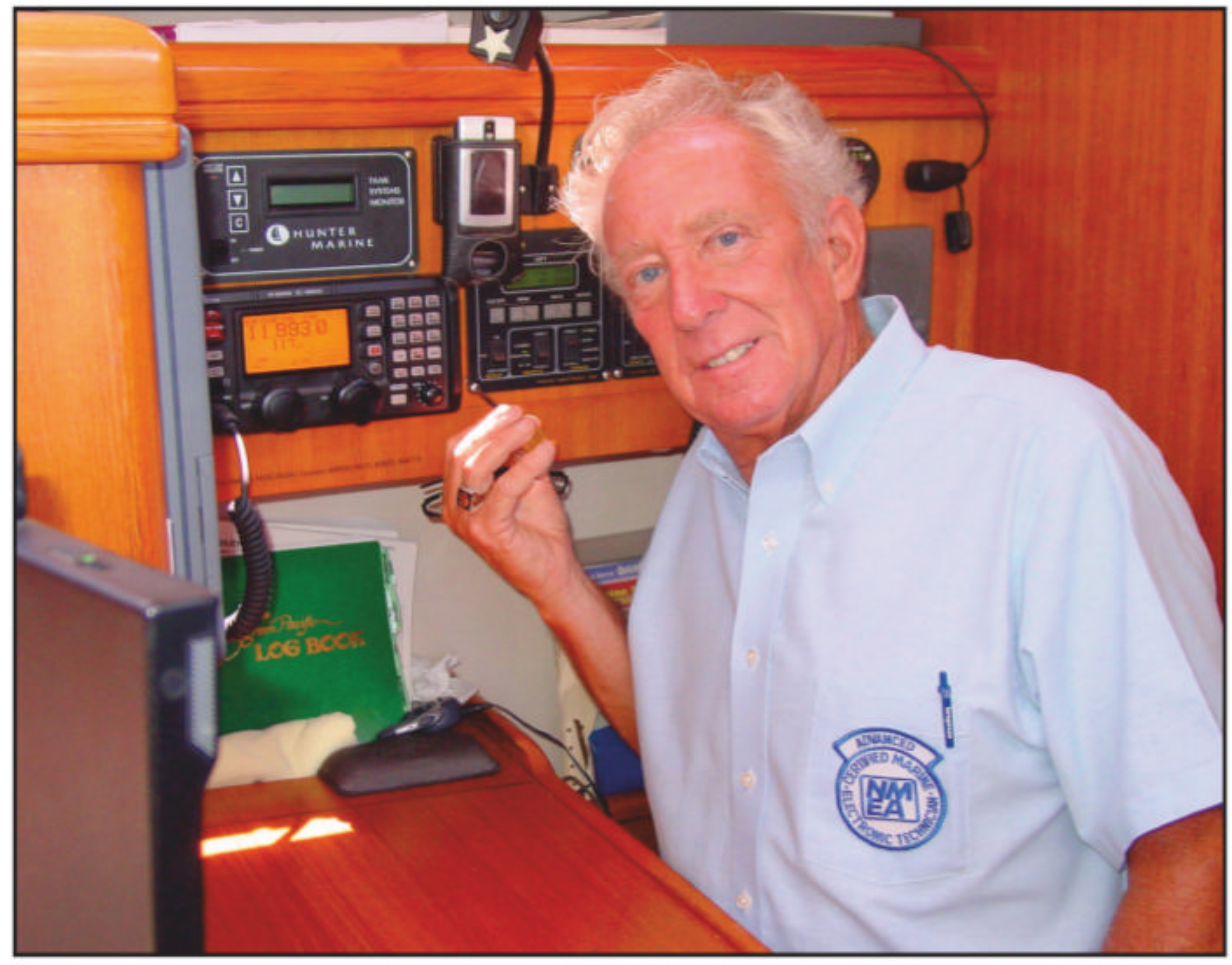
Instead of a smooth dialing VHF knob, they have a big knob that goes click-click-click in the selected tuning steps or use the keypad for dialing in any ham channel.

Nearly all the marine / ham transceivers use common 12-volts DC, they are synthesized with solid-state circuitry, 150-watts output, and provisions for automatic external long-wire antenna couplers.

Icom America continues to be the leading manufacturer of marine SSB synthesized rigs, and many solo ham sailors have an Icom marine SSB rig that will play on HF ham bands as well as ship-to-ship and Coast Guard marine channels legally with a ship station marine radio license.

The Icom M700s, M800s, and M802 are showing up at boater swap meets and used gear markets, and make excellent ham rigs, Some sellers think they are just a big CB radio, and will literally give them away.

SEA and SGC rigs are also seen going for a couple hundred bucks with



All marine SSB radios can also receive and transmit on ham bands.

Gordo's portable SSB pack with a marine SSB on bottom working 14.300-MHz USB.

a matching external antenna tuner for a little extra ... like $50. Even a Kenwood TKM-707 marine SSB was seen at the local boater swap meet, going for $250, including the matching long-wire antenna tuner.

All these rigs usually transmit outside the marine bands with no internal modifications needed. Some will tune ham bands on receive, but won't transmit until you read the manual, or call the factory, for the front panel "TX unlock" procedure. (73# ... 2 mode TX ...) They all unlock for ham.

These marine radios must NOT be used to transmit on ITU maritime radio channels ashore — *monitor only*. However, licensed hams may use any type of commercial radios on our ham bands.

So, if you have boat shops selling used gear and marine electronics, there likely will be some of the "big CBs" sitting on their shelf, looking for a new ham radio home.

mf/lf operating: Life Below the AM Broadcast Band

BY JOHN LANGRIDGE, * KB5NJD

Let's Review Some of the Basics of MF and LF Amateur Radio!

Plus … an Update on Murphy at W3TS and a New World Record on 2200 Meters

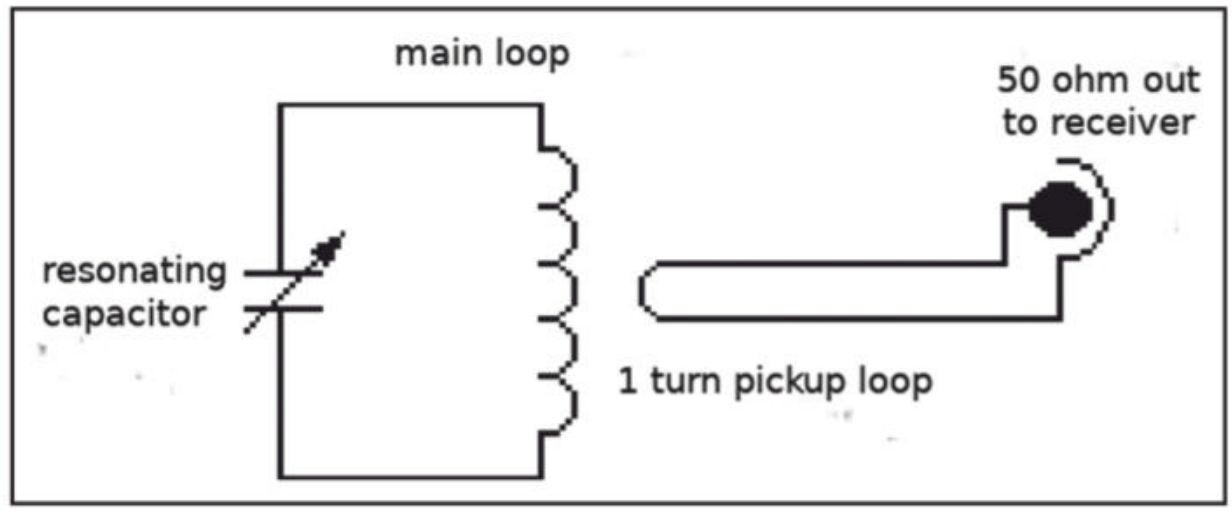
In April 2017 when I wrote my first *CQ* column about 630 and 2200 meters, even before amateurs had spectrum access, it was a daunting task to prioritize just what topics were most important to present first. At the time, rumors from conversations with FCC staff in the Office of Engineering and Technology suggested that the bands would be opening under Part-97 rules sometime in fall 2017. Time was short so a lot of information was presented in those first few articles so that operators not already on the air as Part-5 experimental stations could be ready for the inaugural season.

Now that nearly six years have elapsed, it's probably a good time to rehash some of those early topics associated with station-building for both bands. As I write this article, there have been recent online discussions that suggest a new crop of prospective operators is beginning to seriously consider the possibilities of their own activity on 630 and 2200 meters. A few updates may help avoid reinventing the wheel.

The very first thing I would recommend to a prospective operator is to submit your obligatory notification to the Utilities Technology Council (UTC)[1] that you intend to operate on 630 or 2200 meters or both. The agreement with the UTC stated that amateurs' intent on operating on these bands would submit notification 30 days prior to beginning their operation from a location. You only have to complete the process once for each operating location. As far as I am concerned, and as it's written, you are not prohibited from submitting notification for as many sites as you want. I've submitted notification for almost 100 locations from which I have either operated already or might one day.

Within the 30-day period following notification, UTC can raise an objection regarding operation at the location over concerns with proximity to power line carrier (PLC) systems used for power transmission, switching and monitoring. It's important to note that this matter only covers power transmission lines that contain PLC signals, not power delivery to your home so smart meters and other communications technologies that use power lines will not prohibit your operation from a regulatory standpoint. Those services have no protections afforded them, but they might generate noise that complicates your operation. If your antenna is closer than 1 kilometer to an active PLC system, UTC can raise an objection to your operation.

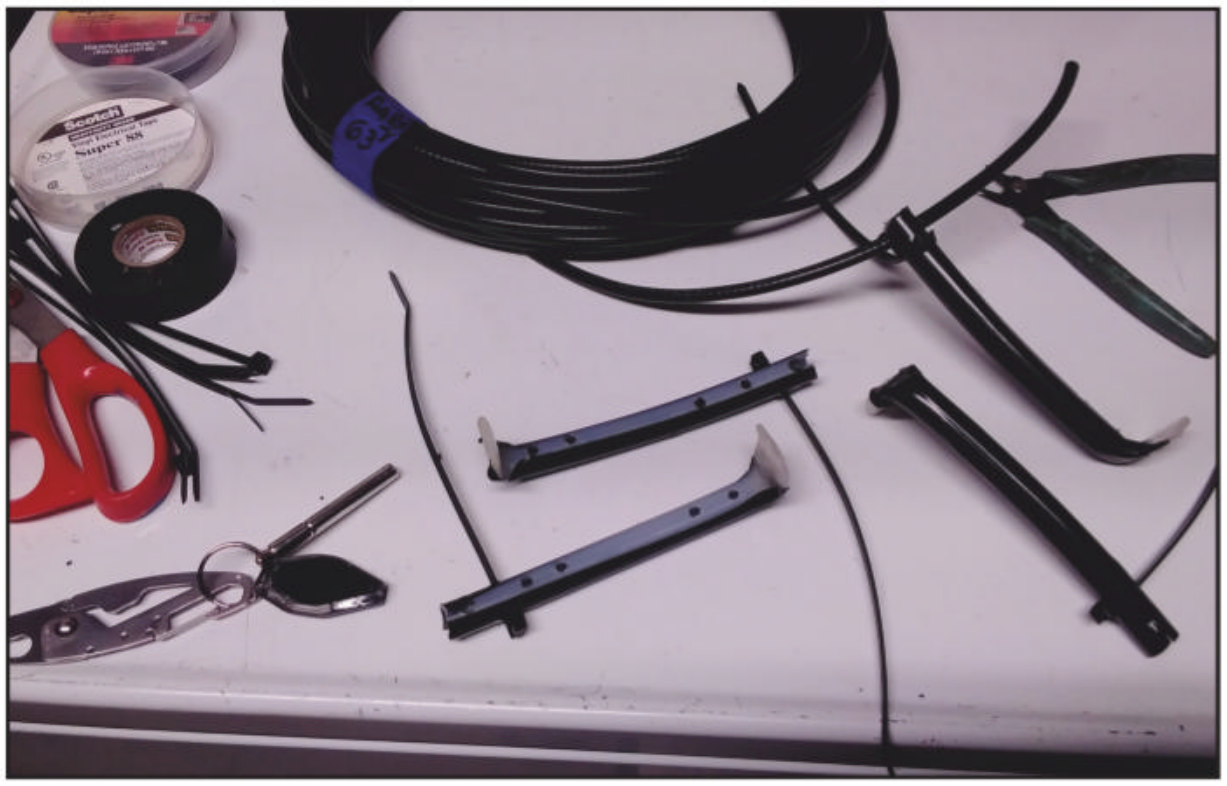
The good news is that several engineers that have worked with these systems have come forward over the last 10 years indicating that, in general, there are no active PLC systems above 300 kHz in the lower-48 states at this



The resonant receive loop design described by VE7SL is common for both small transmit and receive loops in use today. Resonating the loop is simple, by way of a variable capacitor. At KB5NJD, I also include a relay that allows me to select a secondary capacitor bank for 2200 meters in addition to a separate relay across the capacitor that detunes the resonant circuit while I am transmitting in order to avoid high voltage circulating in the loop due to near-field radiation of the transmit antenna. (Courtesy of VE7SL)

Here are the replacement standoff insulators that had been in use for just a few months before failing. The arcing appears worse than what was reported from the previous incident. Mike notes that thinner insulation on the RG8X used for the dipole feeder as well as the Marconi vertical element are likely the cause of this most recent failure. (Courtesy of W3TS)

**827 Middle Run Ct.
Duncanville, TX 75137
<kb5njd@cq-amateur-radio.com>*



Plastic standoff insulators now replace the metallic insulators. A clamp holds the end of the insulator to the mast while the coax is tie-wrapped to the other end. These insulators only maintain spacing and do not have to support the weight as the main support is at the top of the mast. (Courtesy of W3TS)

time. This bodes well for 630 meters but could still be problematic for some 2200-meter operators below that frequency boundary. In fact, one prominent and long-time experimental operator on 2200 meters located in the Northeast was notified that an objection was raised for his activity on 2200 meters under Part-97 rules even after operating on the band at higher power levels for years prior with no problems under Part-5 experimental rules. I suspect that this situation was a clerical error with record keeping but the station in question chose to "do other things" rather than pursue the matter further. Don't let this scenario keep you awake at night. Make your notification with the understanding that it is very unlikely there will be issues. Very few have actually claimed to have been prohibited from operating from their desired location.

This first step is also important because by submitting notification for your site, you prohibit future coordination of these frequencies for PLC use within 1 kilometer. You might be helping someone else in the future even if you have no intention of operating on these bands in the near term.

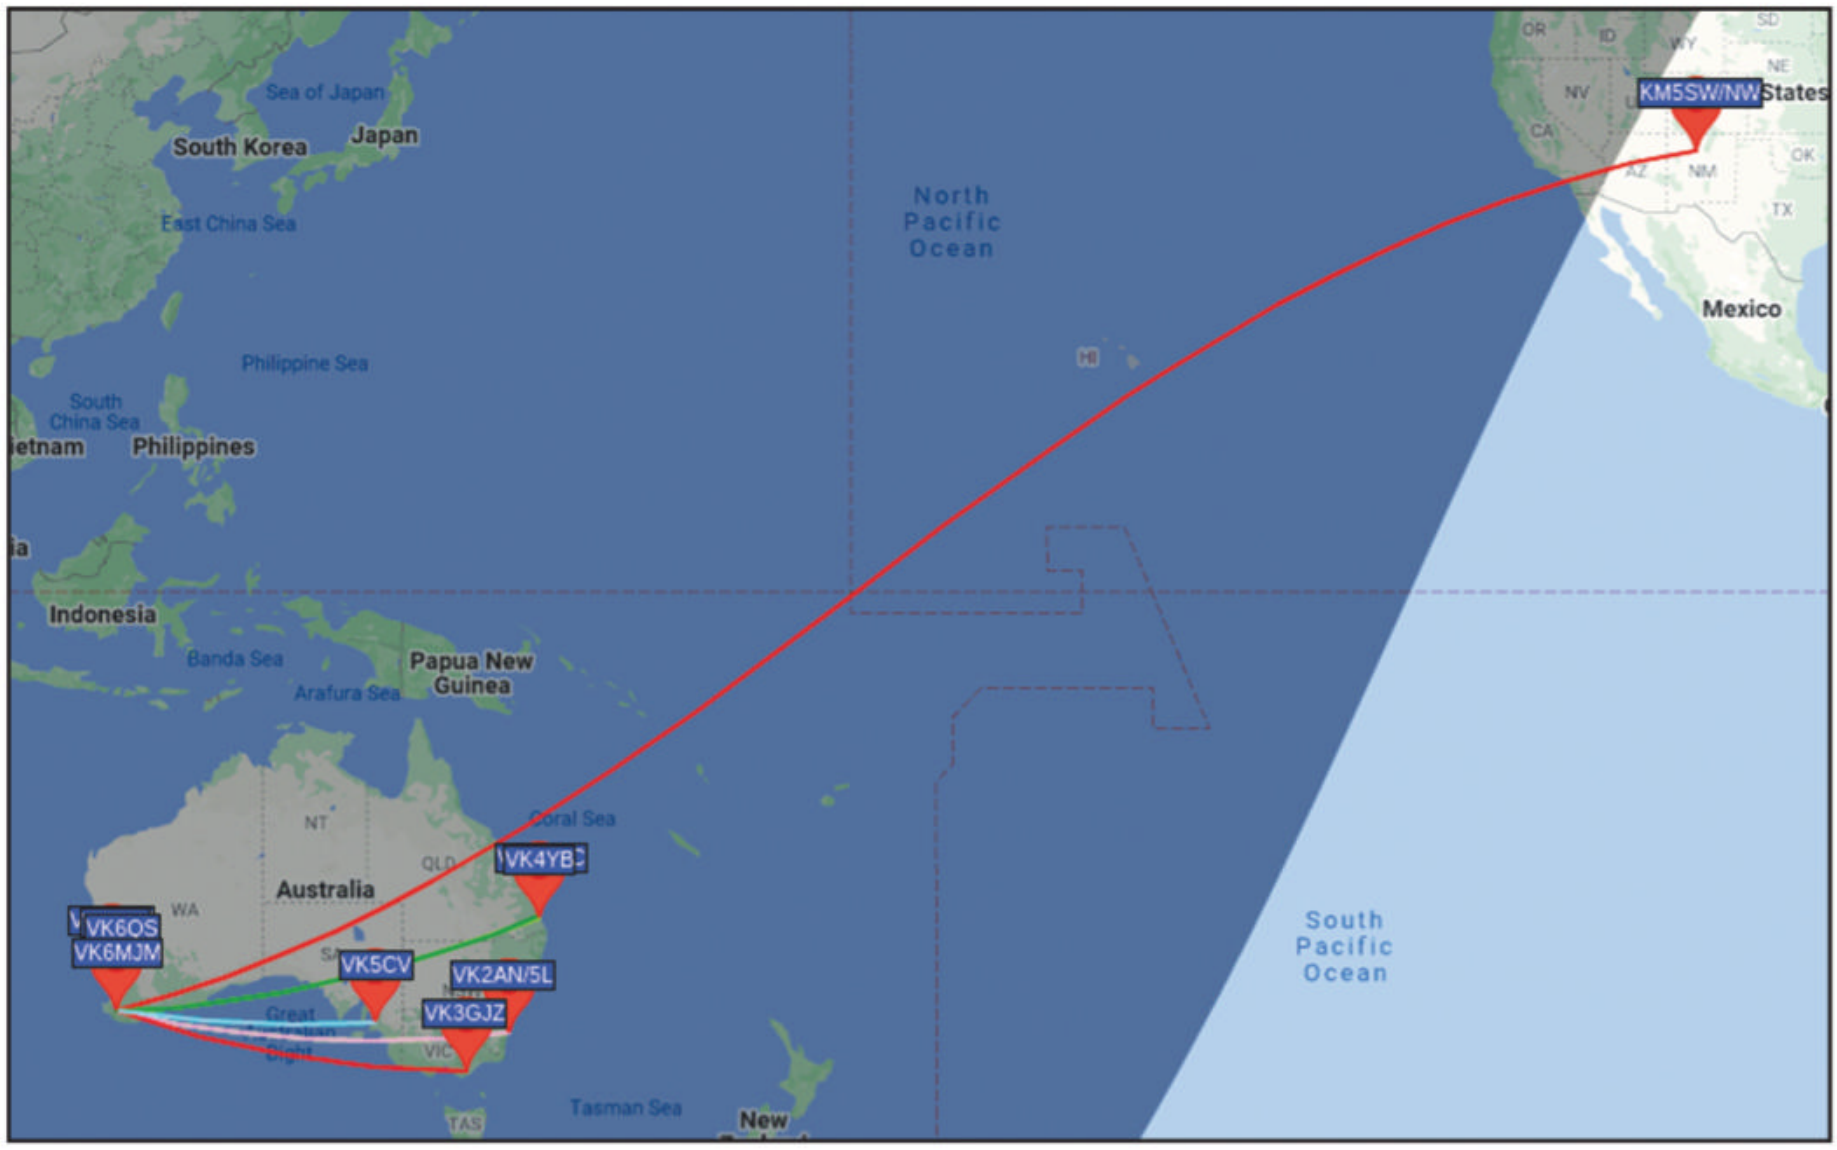
I mentioned a few paragraphs back that existing power infrastructure and general "noisemakers" from the neighborhood could make listening a challenge so evaluating your receive capabilities is a very good thing to do early in this process during the 30-day period following your UTC notification. After all, if you are unable to hear others because of local noise, making two-way contacts may be a problem. Listening with existing HF antennas is one strategy but likely will not offer the level of performance necessary for success on these bands due to poor impedance matching at frequencies for which the antenna was not designed. Those stations with existing low-band receive antenna systems will find these tests more revealing. If using broadcast-band filtering, don't forget to remove it from the receive chain. That has happened more than once to operators who were evaluating their systems.

For those without existing low-band receive antenna systems, a rotatable multi-turn loop that has been resonated on the band of choice can offer considerable performance. The receive loop that I use at my station, which is remotely switchable for 630 and 2200 meters, is probably my best receive antenna out of the six that I regularly use on the low bands. There are many versions of this loop found on the internet but the one I use was originally based on a description[2] by Steve McDonald, VE7SL, of Mayne, British Columbia, Canada. It uses multiple turns on a frame and is then resonated by a capacitor for the band of interest. A pickup wire loop mounted adjacent to the multiple turns of the antenna wire connects to the coax. At my stations I went a step further, adding a step-up transformer between the pickup loop and the coax, allowing a bit more signal down the feed line from better impedance matching as well as a bit of additional common mode protection due to isolated windings.

This last statement deserves a bit more discussion in broader terms. It's very commonly heard that people try receive antennas on 630 or 2200 meters (or even 160 meters) only to report that they did not see any improvement in receive performance. A red flag always goes up when I hear someone say this because it probably says something about their station grounding configuration and component isolation. It is so easy to completely ruin an otherwise perfectly good receive system because of poor grounding and isolation. There is a much greater awareness of the impact of ground loops these days because of the proliferation of digital modes and interfaces between computers, external sound devices, and transceivers.

Ground currents flowing on the shields of coax and other interconnects can become part of the antenna system, masking desired directivity, and making the receive passband sound like noise that can never be nulled. Because of this, I use isolation transformers between receive antenna feed lines and the receive antenna signal buss. Because the receive antenna ports on most transceivers are not isolated from transceiver ground, loops can occur, so I also use isolation transformers between the feed line and the receive-only ports of my transceivers. In all, I probably have 20 isolation transformers in my receive antenna system and while this may seem excessive, all of my receive antennas retain their directivity and are effective.

So how are these transformers built? Very simply put, transformers used here are made with Type-75 binocular cores with five turns on the primary and five turns on the secondary. Of course, a variety of other split-winding options can also be found on the internet. Be careful when mounting transformers in metal boxes, however, because these are *isolation* transformers and should not connect to a common ground on the enclosure. Instead, only one side (primary or secondary — you choose) should connect to the enclosure while the other side should have a floating shield. There are many varieties of chassis connectors that are outfitted with insulation to accomplish ground isolation. If you hate dealing with connectors, an alternative approach is to directly solder the transformer to coaxial pigtails with some type of strain relief in the enclosure, avoiding the need for additional ground-isolated connectors in the receive antenna chain. Mouser



The 16,164-kilometer (10,064-mile) path between VK6MJM and KM5SW was particularly challenging due to a significant amount of distance that the signal had to traverse over land early in the trip. (Courtesy of VK6HP)

and Digikey both carry ground-isolated BNC connectors.

Many modern transceivers work on these bands "out of the box," receiving well and generating a low-level signal much like a signal generator with all of the features of transmit / receive switching built in. This month we will stick to a discussion on receiving, exploring transmitting options next time. The Kenwood 590SG / 890 / 990 lines have native receive at 630 and 2200 meters, meaning that the receivers perform similarly to how one might expect them to perform at higher, more traditional amateur frequencies. These offer far better performance than a general coverage receiver contained in many older transceivers, in my opinion. A broadcast attenuator is jumper-selectable but the location of that jumper seems to vary by serial number so keep that in mind if you decide to make that modification. Details are available from the in-depth manuals on the Kenwood site.

Other transceivers like those from Elecraft also work very well when optioned for operation below 160 meters with respect to band-pass filtering. Several transceivers from Icom are also reported to be very good performers, although I am not certain that all of them have been firmware-modified at this point to generate signals below 160 meters. Those questions should be directed to their respective manufacturers. The Icom 7300 seems to be a favorite of many. Perhaps someday a definitive side-by-side evaluation of all of the current transceivers can be undertaken. In general, transceivers with general coverage receivers tend to perform poorly with respect to sensitivity below the AM broadcast band. Just because a transceiver says it will tune to 50 or 100 kHz does not mean that it will work well there, particularly when coupled to a poor receive antenna, so keep that in mind.

Vintage gear is not uncommon, particularly on CW. Use with digital modes, however, tends to be a bit more difficult, if even impossible, due to frequency resolution, stability, and accuracy. I think many of us have been spoiled by seemingly unlimited DSP capabilities available with modern transceivers that make many otherwise impossible low-power QSOs from the past become reality. If you are using a vintage receiver, patience and a robust receive antenna will offer you the best possibility for success. This may seem obvious but there have been individuals who have complained about not hearing anything, only to report that their receive antenna was an 11-meter CB "ground plane." That's a true story. Dumb luck antennas do exist but they are usually the exception and not the rule.

We will delve deeper into generating a signal as well as transmitting antennas, what works best, and approaches to implementing existing antennas on 630 and 2200 meters in coming columns.

Did the Antenna Repair "Hold" at W3TS?

In last quarter's column, I reported on a visit from Murphy at the station of Mike Michael, W3TS, of Halifax, Pennsylvania. Since the 1990s, Mike has used 40- and 80-meter dipoles that are insulated from his tower as a T-top Marconi vertical on 160 meters and 630 meters as well when the band opened to amateurs. It worked fine until the late summer of 2022 when arcing became a problem. Mike repaired the system that had worked well on 630 meters for several years and on 160 meters for much longer. Sadly, the fix

Sunset at the remote VK6MJM outpost. (Courtesy of VK6HP)

did *not* continue to work and Mike was forced to climb the tower again in late November to replace the work he had done just months earlier.

Mike attributes the arcing this time to thinner outer insulation on the RG8X coax that he is using to feed the dipoles and subsequently functioning as the vertical element on 160 and 630 meters. Since he could not really control the insulation thickness, his repair involved removing the twin lead stand-off assemblies that had been in place for so long, replacing them with a more robust insulator material that should be hard pressed to fail from arcing again. I will report back if these new stand-off insulators fail by some other method. As stated in the previous column, be careful assuming that what has worked in the past will continue to work into perpetuity. Stuff ages and breaks down, like all of us, and the quality of replacements may not be up to the standards of the past. As they say: They don't make 'em like they used to!

New World Record on 2200 Meters

Beginning in 2022, the Western Australian Low Frequency Experimenter's Group (WALFEG), affiliated with the Wireless Institute of Australia (WIA), began operating a remote digital-mode beacon on 2200 meters with the callsign VK6MJM. Peter Hall, VK6HP, of Manjimup, Western Australia, reported in April that the reclamation of an abandoned non-directional beacon (NDB) used for aviation had been a success and the site showed some promise for evaluating long-haul openings on both 630 and 2200 meters.

Initially, 630 meters was the target band, resulting in over 5,000 WSPR reports within the JA, VK, and ZL corridor. The system proved to work well, so plans were made during the Southern Hemisphere winter of 2022 to make modifications so that 2200 meters could also be explored. The modified system was first tested on the air in September, using both WSPR and FST4W-300, the latter being the FST4 beacon variant that uses a 5-minute transmission. Results were mixed with reports around Australia and as far away as Japan. However, the final goal is to be heard in North America or Europe.

November 2022 brought more testing at the remote site using 2200 meters FST4W-300 and while transitioning to summer propagation in the Southern Hemisphere, the Northern Hemisphere was becoming quieter as summer thunderstorms began to subside. A lucky break was found on November 21, 2022 when Paul Johnson, KM5SW, of Jemez Springs, New Mexico, reported the VK6MJM beacon three times at -36, -37, and -37 dB S/N at 1320, 1350, and 1405 UTC, respectively. It was reported a few hours later by Alex Lesnichy, R7NT, of Tagnarog, Russia, that the 16,164-kilometer (10,044 miles) path was the longest recorded 2200-meter reception between Oceania and North America ever reported. Alex is the keeper of the "Around the World on LF" (AWLF) record site which was not accessible at the time that this article was prepared.

Peter noted that the record was accomplished using just 0.8-watt EIRP despite the WSPR data that indicated 1.0-watt EIRP. Peter rushed to leave the site before dark where travel can be treacherous on severely compromised roads, so the entry was an error. Congrats to all involved and hopefully this is just the beginning of amazing things from this remote outpost on 2200 meters.

That's all for this month. If you have questions or comments, please contact me by email at <KB5NJD@gmail.com>.

Winter Specials for the Hams in Your Life...

Two Calendars To Choose From This Year!

The CQ Ham Radio Operator's Calendar with fifteen spectacular color images relating to amateur radio shacks and antennas from across the country; DXpeditions to exotic places and fellow hams!

The CQ Ham Shack Project Calendar which features fifteen spectacular color images of amateur radio building projects.

2023-2024 Calendars–Now on SALE–Save $5! Only $9.95 plus shipping!

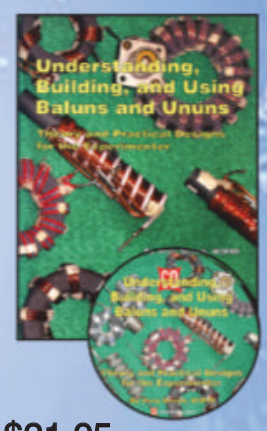
Calendar shipping to USA. . . only $14.95 (includes $5.00 shipping charge)

Calendar to Canada/Mexico . . . only $17.95 (includes $8.00 shipping charge)

Calendar to All Other Countries . . only $22.95 (includes $13.00 shipping charge)

Understanding, Building & Using Baluns & Ununs

by Jerry Sevick, W2FMI

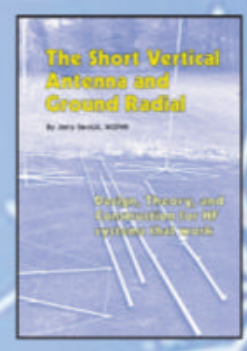


The successor to the popular and authoritative Baluns and Ununs. Great deal of new tutorial material, and designs not in previous book, with crystal clear explanations of how and why they work.

8.5 X 11 Paperback $21.95
CD Version $15.95
Buy both for only $32.95

The Short Vertical Antenna and Ground Radial

by Jerry Sevick, W2FMI

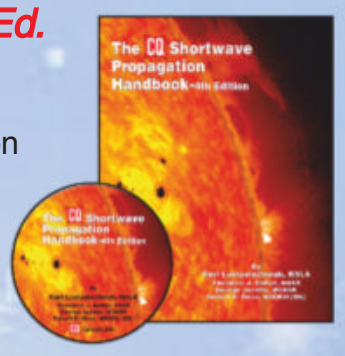


This small but solid guide walks you through the design and installation of inexpensive, yet effective short HF vertical antennas. With antenna restrictions becoming a problem, it could keep you on the air!

6 X 9 Paperback $10.00

The CQ Shortwave Propagation Handbook-4th Ed.

by Carl Luetzelschwab, K9LA

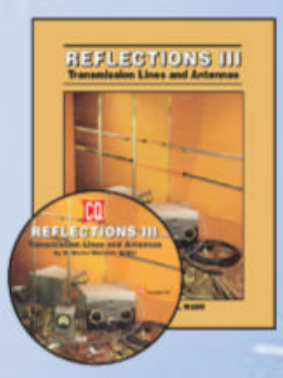


Fully updated and expanded to include the latest propagation forecasting tools, as well as our time-tested "analog" tables for making your own customized predictions, the 4th edition of *The CQ Shortwave Propagation Handbook* is a must-have resource for any DXer, contester or emergency communicator.

8.5 X 11 Paperback $42.95 CD Version $32.95
Buy both for only $61.95

Reflections III

by Walt Maxwell, W2DU



All the info in Reflections I and II and more! This completely revised and updated, 424-page 3rd edition is a must-have!

8.5 X 11 Paperback $45.95 CD Version $35.95
Buy both for only $70.95

Books, CDs & DVDs Shipping & Handling U.S. add $7 for the first item, $3.50 for the second and $2 for each additional item.
CN/MX $25 for 1st item, $10 for 2nd and $7 for each additional.
All other countries $35 for the first item, $15 for second and $10 for each additional.

ham radio explorer

BY ANTHONY A. LUSCRE*, K8ZT

Multiple Radio Activities with One Starting Point

Two-for-one … I love it when activities complement each other, like that well-planned trip that accomplishes multiple errands in the shortest time and the least amount of driving. It is often called "... killing two birds with one stone." Solving two or more problems with a single action. There are so many aspects of amateur radio to explore that start with one project and accomplish multiple ends.

Sound Card Modes

Many new radio communication modes have been developed in recent years. Most of these can be lumped into the *sound card modes* (SCM) category. They depend on various tones for transmission via radio. FT8 and FT4 (*Photo A*) are part of the WSJT-X suite. WSJT-X also includes other SCMs used for specific activities such as meteor scatter and EME (Earth-Moon-Earth) contacts.

Typically, there are four parts to a station capable of SCM communication: a radio capable of SSB transceive, a sound card interface, a computer, and appropriate software (*Figure 1*). For most purposes, the radio acts the same as it would during SSB transmissions, sending and receiving signals with multiple tones and amplitudes.

The sound card is simply a way to take the incoming audio of the radio's receiver and input it into the computer's incoming audio channel (often referred to as a microphone or recorder input). Conversely, the sound card takes the encoded audio output of the computer and feeds it into the radio's microphone jack to be sent out by the radio's transmitter. The "magic" of these modes actually takes place, not in the sound card, but in the software running on the computer. These programs encode information inputted via a computer keyboard (or recorded macros) into an audio signal to be sent to the radio via the sound card. On receive, the software decodes the incoming audio signals from the radio via the sound card and converts them into the text we can read on the display monitor.

A Sound Card-Equipped Radio is the Starting Point

Many current radios have built-in sound card interfaces. You can easily add an external sound card interface for radios that do not have one built-in. Several popular commercial models of interfaces are under $200 (*Table 1*).

Once you have a radio with a built-in sound card or external interface with cabling, you are ready for many new modes and projects. Follow these steps to get started with a Microsoft Windows™ computer:

1. If your radio requires driver software for the computer interface, install the current version of that software before connecting your radio to the computer with an interface cable — see the manual for information on drivers and check the manufacturer's website for driver software. After installing, note the Com port that the radio interface has been given in Device Manager.
2. If you are using an external sound card, attach all cables to the radio and USB cable from the interface to your computer.
3. You should see a new sound card in your list (probably with the word CODEC in the name).
4. You will need to set the mode to DATA or USB, depending on your specific radio model.
5. You may also have to make changes to the radio's settings — turn off DSP and DNR, set filter to widest setting, etc. These settings may vary, depending on the specific SCM you are running. There are a lot of how-to videos for different radio models on the internet and YouTube.
6. Install software for the specific SCMs that you want to run.

Install Sound Card Mode Software Programs

You can add dozens of new modes to your amateur radio repertoire by choos-

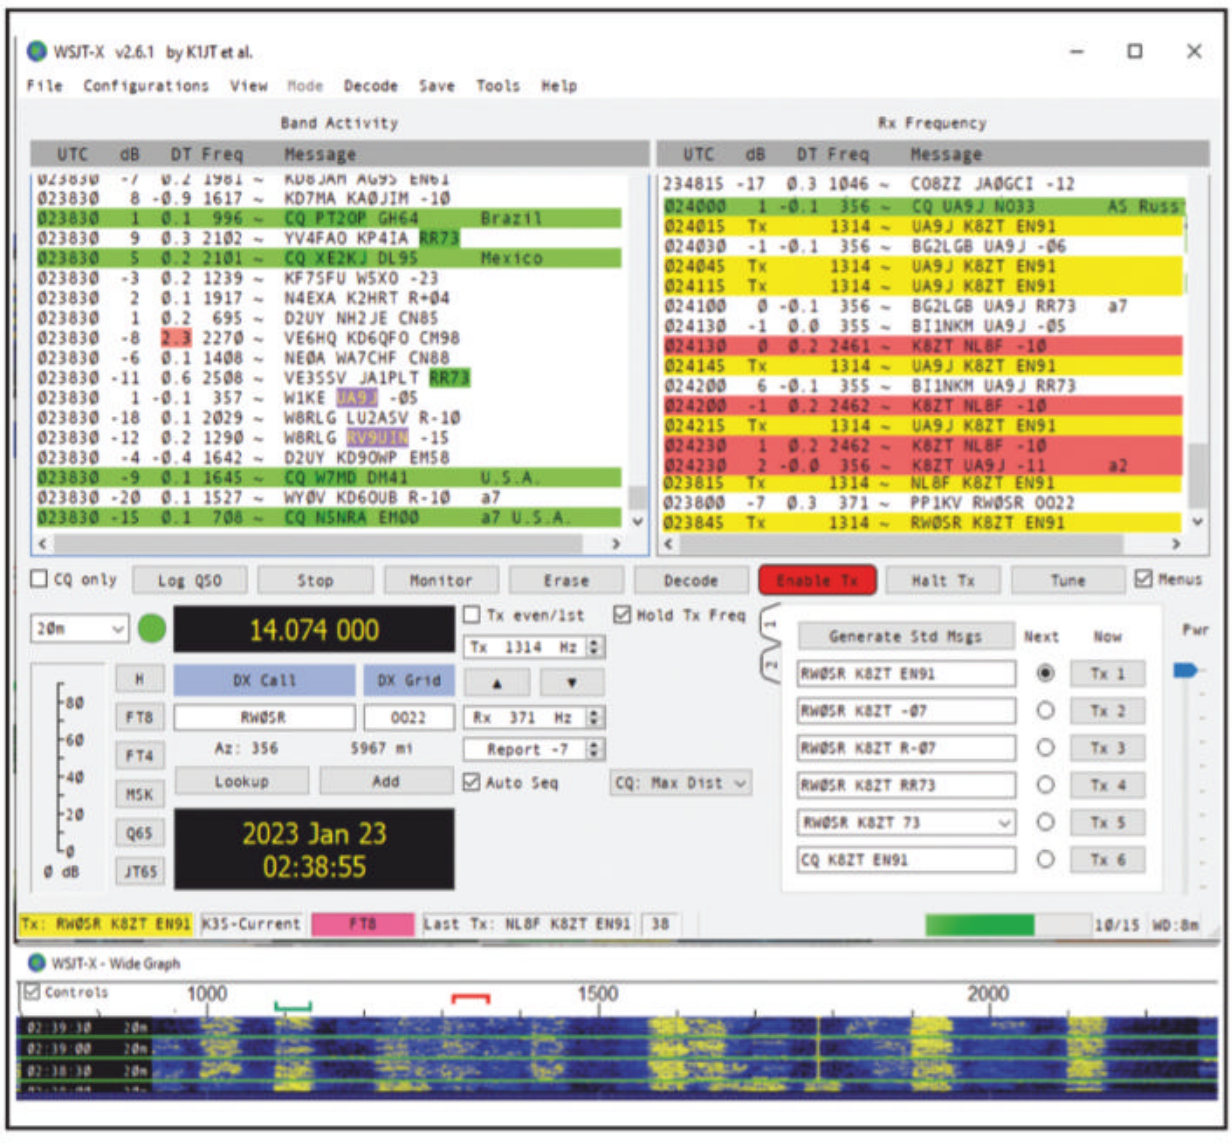

Photo A. Author working Asiatic Russia and Alaska with 5 watts on popular sound card mode FT8.

**Email: <k8zt@arrl.net>, website <www.k8zt.com>*

ing different software. Two of the most popular modes are FT8 and FT4. These are part of the **WSJT-X Suite** (for more information, see my slideshow <tiny.cc/ft8ft4>). WSJT-X can also provide you many other weak-signal modes for meteor scatter, EME, etc. Installing **FLDIGI** software <www.w1hkj.com> gives you a large number of SCMs, including PSK (and its many versions), Hellschreiber, DominoEX, etc., plus sound card versions of RTTY, CW, and WEFAX. There are a number of other programs with SCM, including Ham Radio Deluxe's "Digital Master, formerly DM-780, an all-purpose ham radio digital modes communications package."

An Additional Step to Run Winlink, VARA AC, etc.

Pactor, a mode popular a few years ago for digital communication and email forwarding, required a rather expensive hardware modem. Much of Pactor activity has been replaced by VARA, a high-performance HF software-based modem based on OFDM modulation. If you would like to run Winlink or other related modes, you will need to install the EA5HVK weak-signal software which can be found at <https://rosmodem.wordpress.com>. There is a lot of information on the software at the site, which I will not be able to cover in this article. After downloading and installing, you will need to register your software and pay a small registration fee.

Even More

Just like in the late-night TV commercials — "wait, there is even more!" Once you have your radio and sound card interfaced, you can easily record on-air audio with your favorite software, transmit SSB exchanges in contests as macros, and more. We have just scratched the surface of current SCMs, and new ones are always on the horizon, so this month's exploration can continue indefinitely.

That's it for this month. If you are interested in some of my recent ham radio presentations to radio clubs via Zoom, visit <tiny.cc/k8zt-p>. Remember, I am always looking for information on your new activities, ideas for future columns, and feedback from this column, so please email me at <k8zt@arrl.net>.

digital connection

BY DON ROTOLO,* N2IRZ

Boxing Days

TARPN Nodes and Their Containers

I've written many times about the TARPN packet networking project <tarpn.net>, and this month we'll have another look at a related project. I presume that most *CQ* readers know enough about packet to know whether they'd enjoy it or not, so there's no attempt here at conversion. After all, CW enthusiasts don't do it because it's state of the art, but because they find it fun. As it is with packet. Its value as a learning tool cannot be overstated and the chat feature in TARPN Home is a fun way to unite the local packet community.

If you want to gain traction in the promotion of (something), it is often a good idea to minimize the level of effort required to get started. Efforts for most anything include publicity, funding, sourcing bits and pieces, clear instructions on what to do and how to do it, as well as a support system for when things go cattywampus [*this is a new word for me –ed*].

TARPN has seen a reasonable level of success by focusing on these points and delivering reasonably good and readily available "products." But one of the key elements, as I've learned through my efforts in Atlanta, is having an effective advocate and promoter. From first hearing about a project to visiting someone to see things in action to active participation, there needs to be a central contact where anyone and everyone can find out what they need to know.

Another key element is making the important components available, ideally at a reasonable price, or at least identifying a reliable source. A Raspberry Pi is a full-blown computer and can be purchased for approximately $55, serving as the core of a TARPN node. Well, since the pandemic they're harder to find, but not impossibly so. The TARPN software is free, installation and configuration are mostly automated and very well documented. The NinoTNC is a very capable

*c/o CQ magazine
Email : <N2IRZ@cq-amateur-radio.com>

Photo A. A prototype TaddBox, designed to hold a complete three-port TARPN node (less antennas, of course). On top is the Raspberry Pi computer, and below are three radios and their associated KISS TNCs. There are some parts missing here, such as cables, power supply and backup battery (these sit on the very bottom shelf), and the Pi power supply and fuse box.

Photo B. Using a CNC router makes easy-to-assemble joints like this a trivial matter. Tightening the screw makes a strong joint that can easily be disassembled if needed.

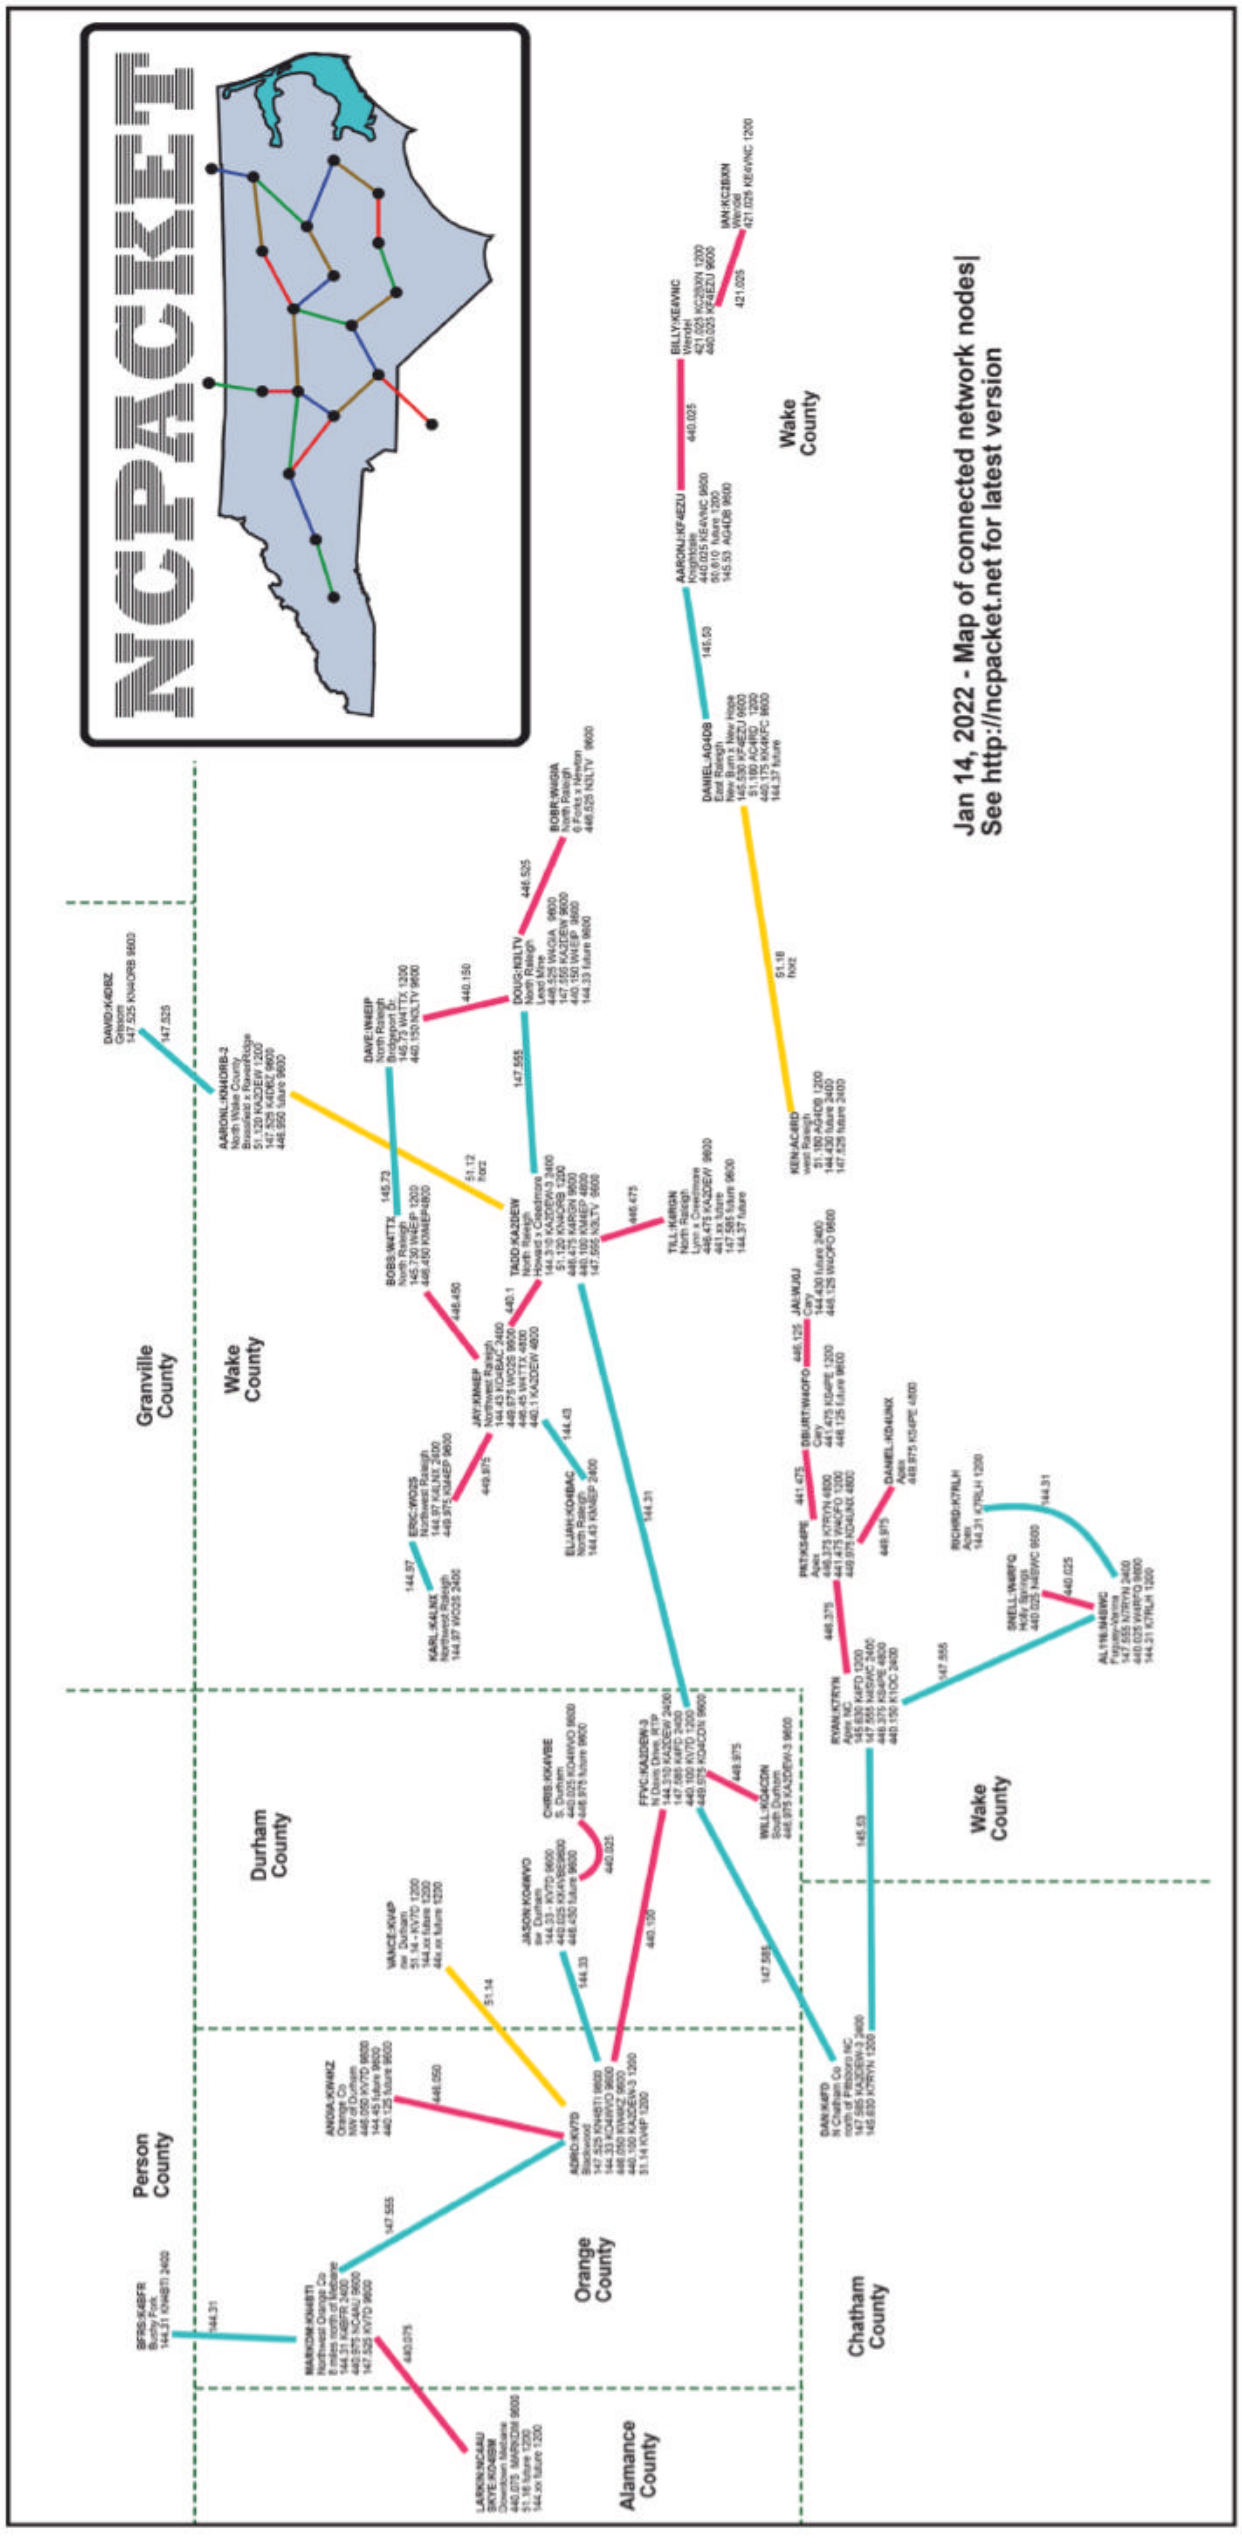

Figure 1. The North Carolina TARPN network as of mid-January 2023. The latest version of the network map can be found at <ncpacket.net>. (Courtesy of Tadd Torborg, KA2DEW)

KISS Modem that can be had as a kit for about $45, and a pre-assembled SMT version is in the works. Having these key components readily available from reliable sources eases the burden on the potential participant. The rest of the various parts are much the same: Some from DigiKey or Mouser, some off Amazon, and so on.

Once you get all this stuff, you must put it somewhere. Leaving it all strewn about on a shelf or table is inviting catastrophe: There are many bits and pieces that can and will throw sparks and smoke if something conductive hits them just right. While the TARPN builder pages show some examples of simple plywood or wooden IKEA boxes that have been used, I wanted something a little better.

The goals for building the TARPN node enclosure included a reasonable cost, extremely easy assembly, shippable in a USPS Priority Mail Flat Rate® Medium Box, durability, room for a three-port node with radios, TNCs, the Raspberry Pi, and power for everything. As it turns out, shipping is about a third of the cost, since half-inch plywood isn't light as a feather, and lumber prices are higher now than almost ever. One can certainly build a box, but this one is fairly ideal for the purpose.

My purpose this month is not to create a market for these boxes. Frankly, it isn't a business I want to be in. Instead, I want to document what it is, offering the G-Code and part outlines so almost anyone can make their own if they so desire (write me if you are interested). In an ideal world, someone with access to a CNC router would start a small business and supply the world — with my blessings.

Aye, there's the rub: A CNC router. Not everyone has one in their basement. But if you search around, this is a standard fixture — as common as a table saw — in virtually every makerspace around. And, not sure you've noticed, there are a lot of makerspaces around.

One box can be cut from a 24-inch square of half-inch plywood, and the three shelves and Pi support from another 24-inch square of quarter-inch plywood with a bit left over. The 9- x 9-inch top cover can be either half-inch (recommended), or quarter-inch ply-

Photo C. The major parts of the TaddBox are cut from a 24-inch square of half-inch plywood using a CNC router. Note the brackets that are cut from the insides of the bottom and one side, saving material, weight, and cost.

wood if you want to use the leftover from the shelves. Assembly uses screwdrivers and an optional hammer-like object — in case something needs persuasion. The box is strong enough to support me (200 pounds) but reasonably lightweight, and disassembles and knocks down flat quickly and easily for shipping or storage.

We start with two sides, a bottom and a top. These form a box, held together with #8 machine screws and nuts as seen in the photos. We insert the Pi supports into the top and hold them in place with wood screws. The shelves slide into the machined slots, as does the Pi support plate, all held in by friction. The top cover is hinged, protecting the Raspberry Pi and some of the power supply items from falling objects yet allowing easy access. There's room in the back for cables.

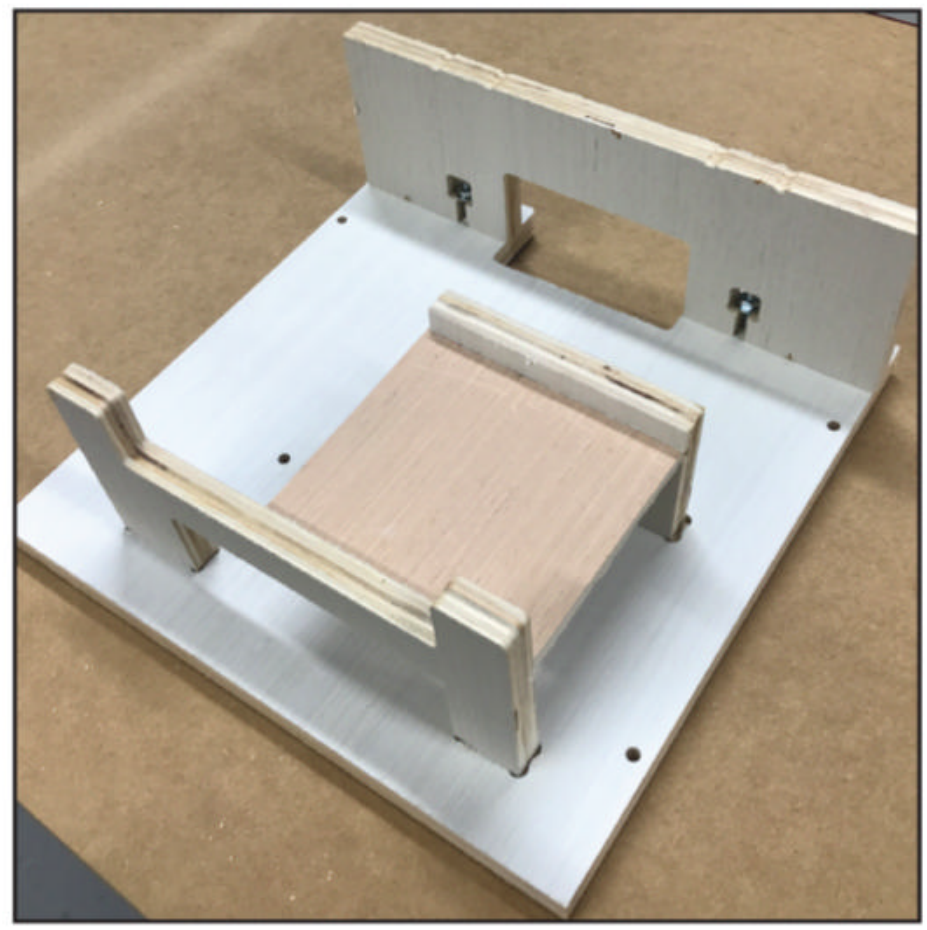

Photo D. A close-up of the top, showing the details of the shelf for the Raspberry Pi and the rear bracket for the hinged cover. The Pi support brackets are set into routed pockets on the top, then held in place with a wood screw from beneath. The front bracket supports the front of the hinged cover and provides a place for installing the Node Control Panel from Larry, W8NP. This is a prototype — I anticipate moving things around a little to gain further efficiencies.

Everything is readily accessible. Disconnect the antenna cables and power supply cord and the whole thing is portable. At about 15 x 10 x 10 inches, the enclosure fits in smaller spaces. The open shelf design allows for heat dissipation. For use in high humidity, or for aesthetics, it can be painted. By the time you read this in early March, I expect that the TARPN builder pages will explain how to get one of these enclosures if you decide not to build one yourself.

Hamvention

Before we close for this issue, some brief comments on Hamvention®. Held in Xenia, Ohio it is the largest gathering of radio amateurs in the world. This year it will run from Friday May 19th through Sunday May 21st. If you haven't made plans to attend, or especially if you've never been, you should try this year if you can. Certainly, if you're within driving distance (which, for me, is about 10 hours), but even if you have to fly in to Dayton (DAY), Cincinnati (CVG), or even Columbus (CMH), it is worth the trip. Find a hotel now, as they tend to fill up around now. It's not unusual to stay 20 or 30 miles away — traffic is rarely an issue (unlike in Atlanta) so travel times are reasonable. I'm staying in Fairborn, Ohio, just 10 miles away and right around the corner from the Wright-Patterson Air Force Museum. Indeed, the museum alone is a day's effort, and really worth it.

The Hamvention flea market takes more than a day to thoroughly examine, and the several hundred organizations and vendors (many with "show specials") could easily consume the rest of your time and cash. Food galore — almost none of it healthy [*but delicious –ed.*] — and a virtual guarantee of rain and/or thunderstorms — bring your rain gear. A small backpack is a great idea.

It is true: If you can't find one at Hamvention, it doesn't exist. And, if you seek bargains — and who doesn't — that's what you'll find. The educational value alone (hey, what's this thing?) is worth the entire expense. I don't care who you are, I guarantee there will be at least one thing at Hamvention that you don't know what it is. And sometimes, the seller doesn't know, but *you* do — the makings of a supreme bargain indeed.

That's all I have this time. As you may have guessed, I'll be at Hamvention. You can find me in my bright yellow FRC Robot Inspector cap, poking around the bargain bins and looking for things to write about.

By the way, if you have any suggestions for that, let me know. *– Until next time, 73 de N2IRZ*

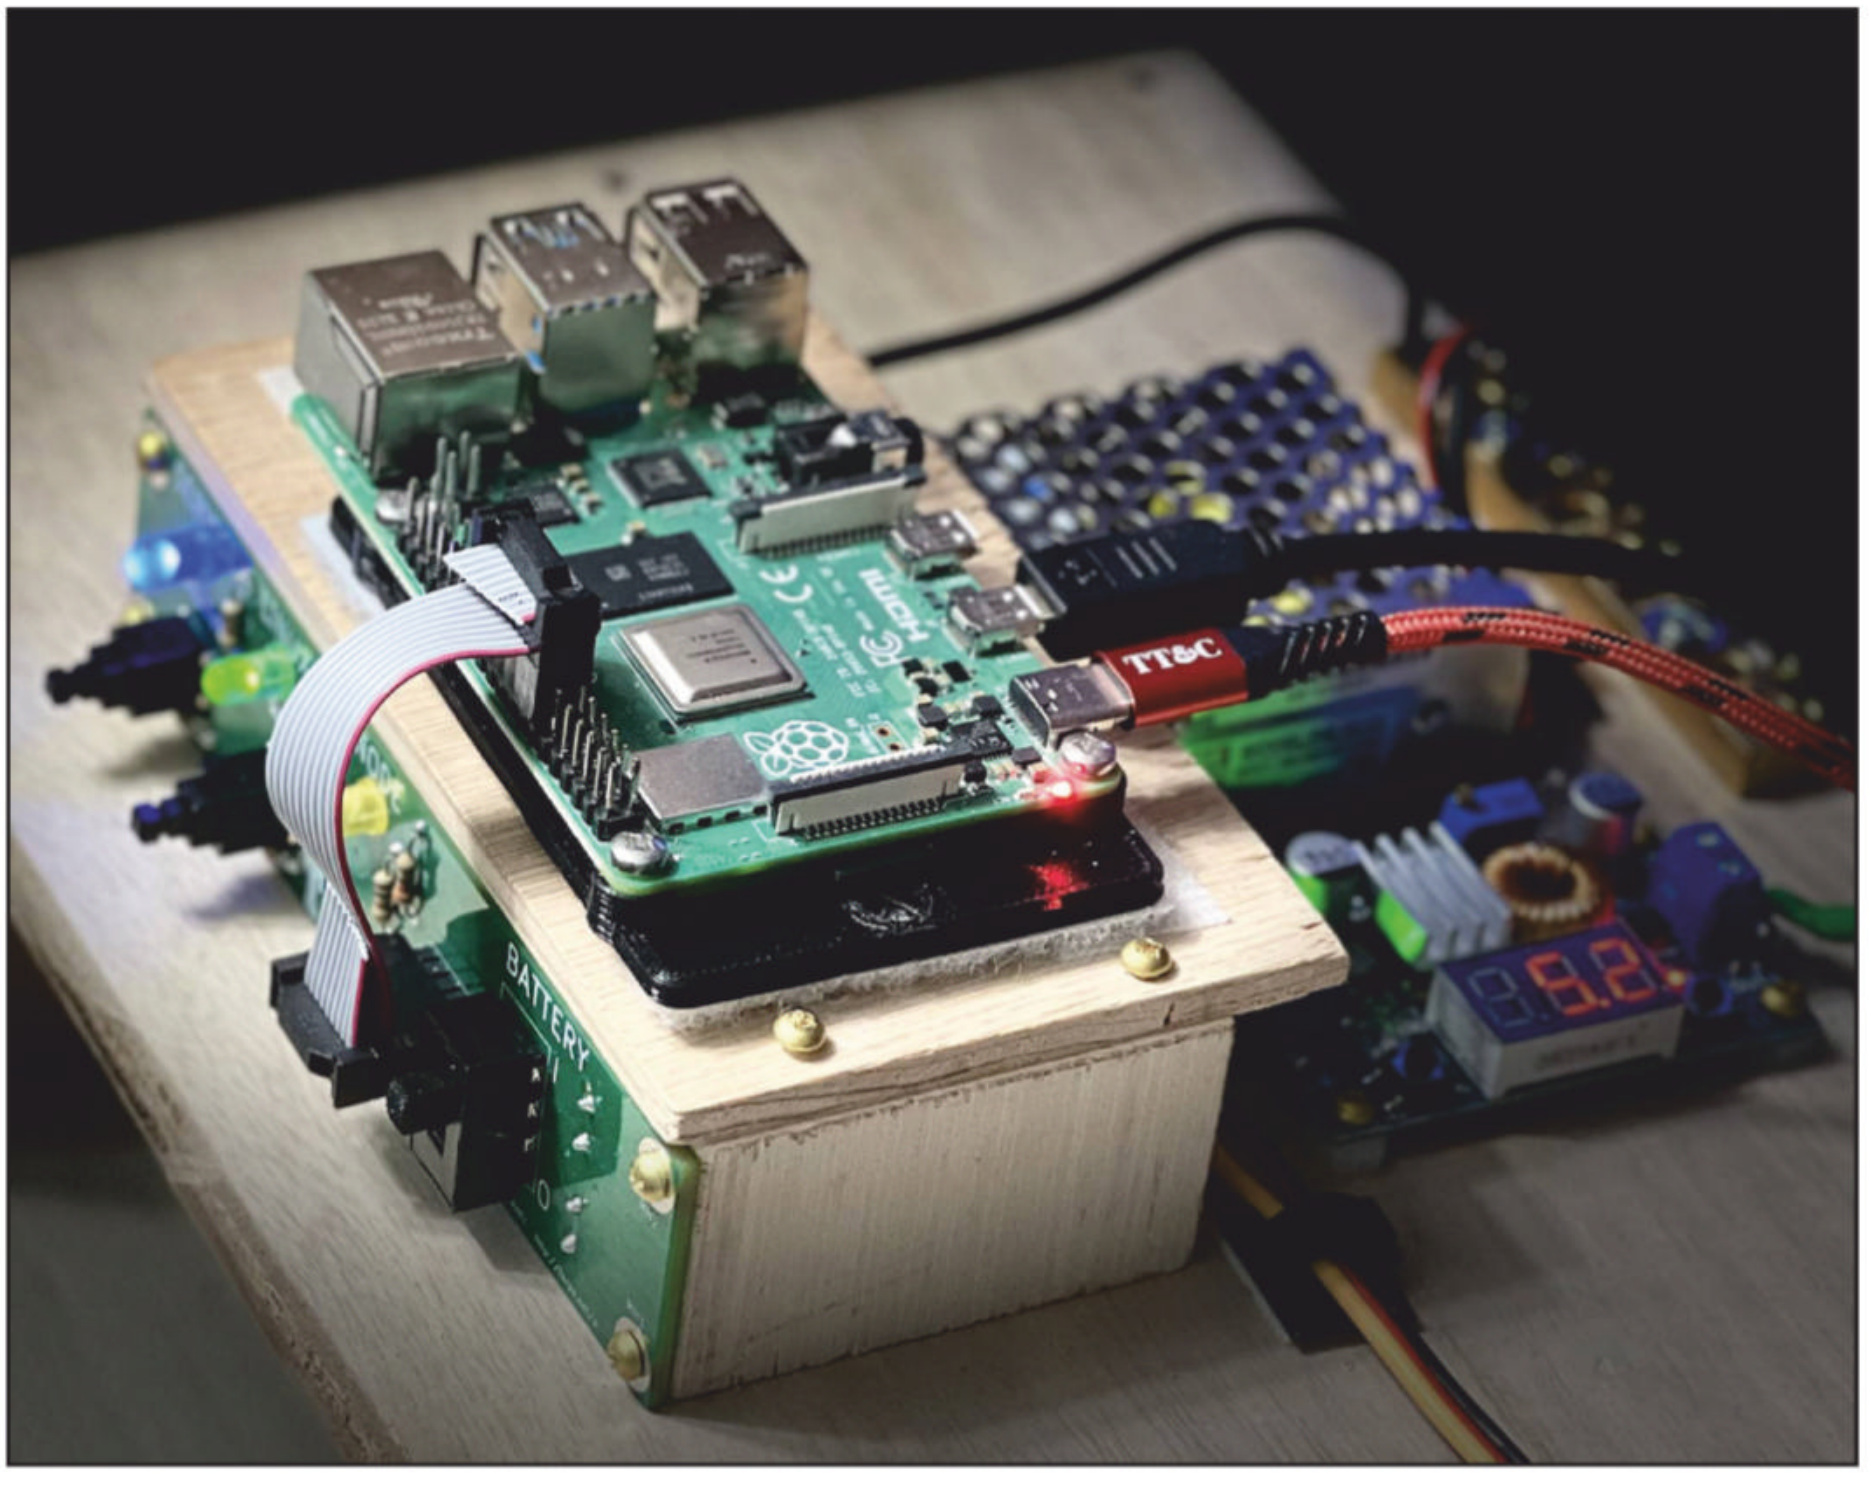

Photo E. An early prototype showing the equipment that is mounted to the top: Raspberry Pi, Node Control Board, Pi power supply, and DC-DC converter. The fuses and some other bits are beneath the Pi. (Courtesy of Tadd Torborg, KA2DEW)

learning curve

BY RON OCHU, KOØZ

Activating Grids

It's still wintertime and it's cold and rainy as I compose this article. I'm taking a short break from working the WRTC (World Radiosport Team Championship) stations and the Congo TN8K DXpedition to compose my thoughts for this March article. The higher solar flux, along with nice A and K indices, makes taking time away from my transceiver to write just a bit harder. And just think, Solar Cycle 25 is ramping up and we have many more years of increased ionospheric activity which translates into long-distance (DX) contacts. Also on the brighter side, when you read this, it will be transitioning from winter to spring, so it's time to start planning outdoor ham radio activities.

Would You Consider?

May I suggest seriously considering participating in an upcoming VHF (very high frequency) contest or two? There are many of them sponsored by CQ and the ARRL. In June, there is the ARRL VHF contest. CQ's VHF contest is in mid-July. September is another ARRL VHF contest, followed by yet another in January. Various VHF groups and societies sponsor VHF and higher *sprints*. Sprints are shorter duration contests usually conducted on weeknights. They can be a lot of fun to participate in, but weekend contests tend to bring out more activity.

VHF Contests, You Say?

Newly minted ham radio operators participating in VHF contests? Are you serious? Perhaps, as a newcomer to ham radio and to ham radio contesting (radiosport), your VHF contesting "arsenal" consists of a dual-band handi-talkie (HT) and a rubber duck antenna. You don't have a multiband VHF / UHF (ultra high frequency) multimode (SSB and CW) transceiver and directional antennas. Not yet anyway. So, mister *CQ* writer, try that one on for size.

Okay, let's try!

Commitment

The first thing we need to do is to check out the rules for the VHF contests to get a feel for the "lay of the land." Are you aware some VHF contests have a category designated just for FM (frequency modulation) in addition to single sideband (SSB) and digital? Other important considerations include: When is the contest? What is the contest exchange (information exchanged in a contact; see below)? What category should my friends and I enter? Categories include fixed (operating from your location), rover (driving to various grids), single operator, multi operator, etc.

*Email: <ko0z@cq-amateur-radio.com>

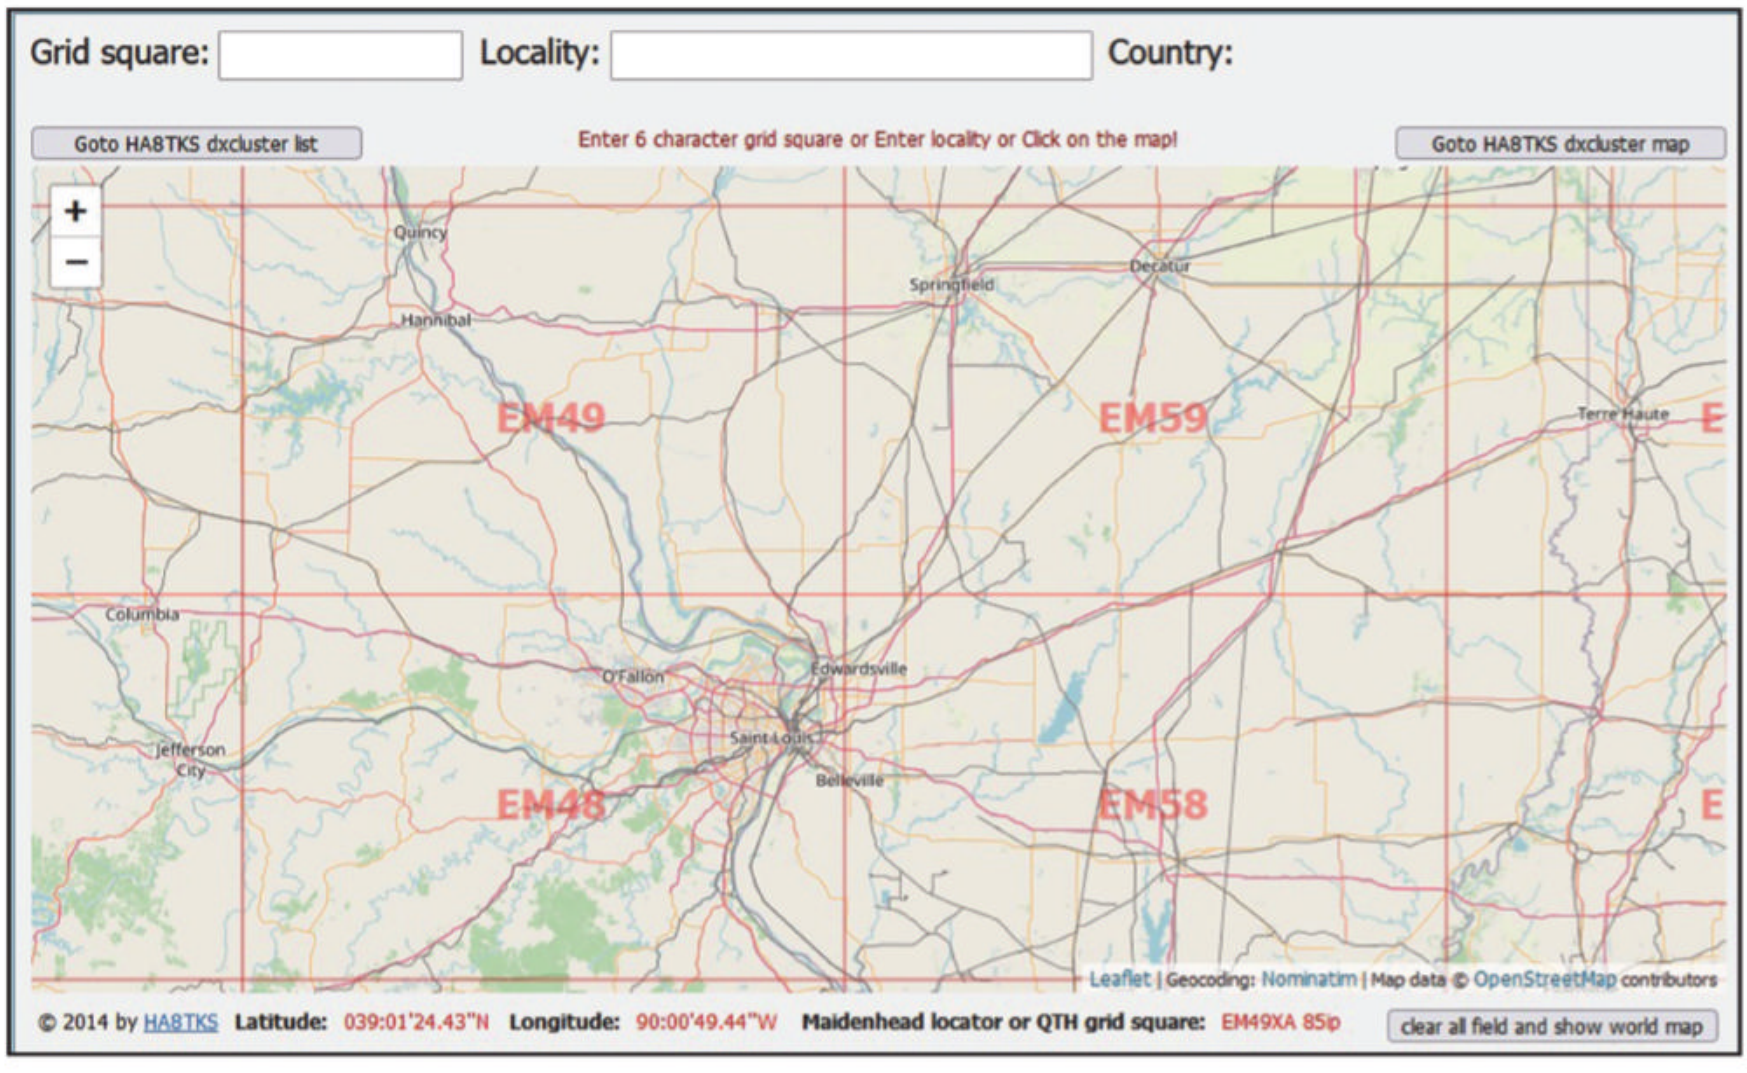

Photo A. Screenshot of four grid squares: EM48, EM58, EM49, EM59. Going to where four grid squares come together can make for a fun VHF DXpedition and a nice way to accumulate multiplier points. (Photos by KOØZ, except as noted)

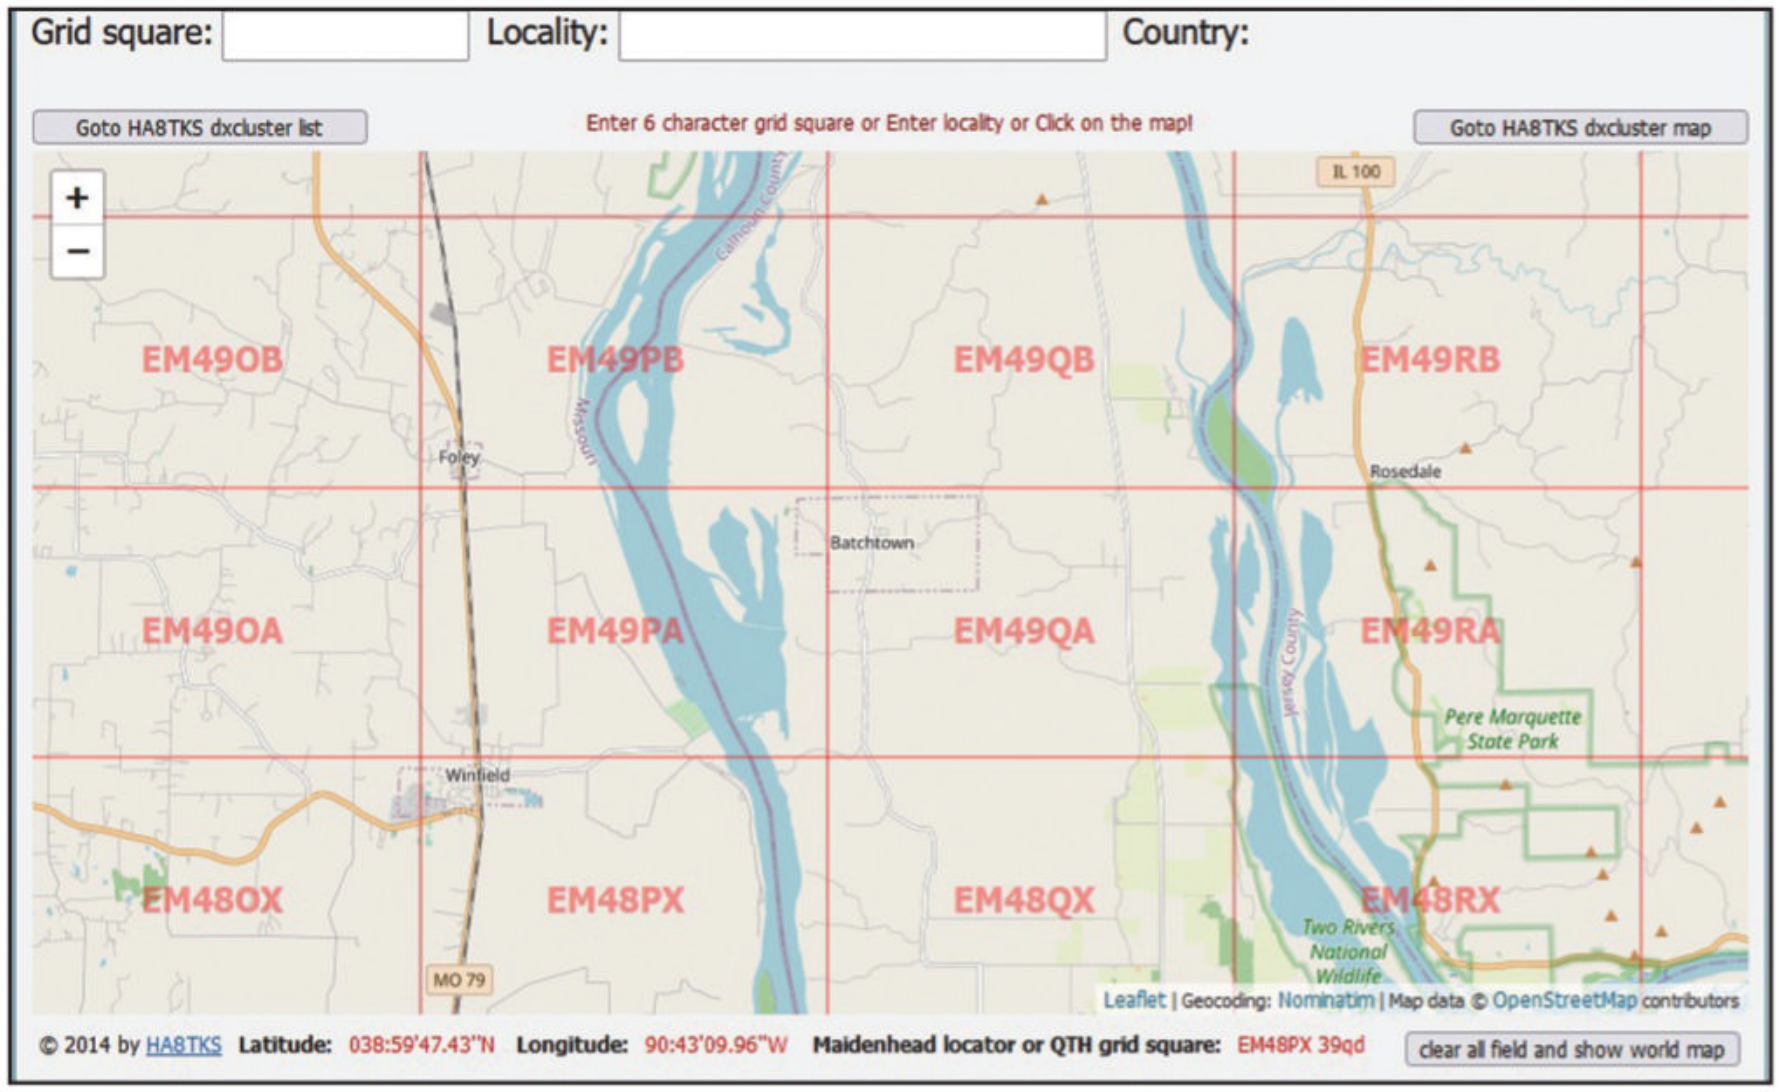

Photo B. Screenshot of grid squares EM49pa and EM48px. Where these two grids come together is a short drive for Herbert, AF4JF; Ron, KOØZ; and Harry, WAØCNS. A mile either north or south puts us in one or the other grid squares. Not as much of a challenge to overcome for VHF contacts, but it is a great way to get "radioactive" and to have fun doing it.

Photo C. Army Corps of Engineers Mississippi River Lock and Dam 25 is in grid square EM49pa and just a mile or south of that location, we are in the next grid square EM48px. It's a great place to start the contest. It's also a great place to see bald eagles during the winter time.

The next item of business is to get a few friends in on the idea. You don't have to feel like you are trying to take on the whole radiosport community and win the big prize (which generally is nothing more than a plaque and bragging rights). Maybe the closing scene of *Butch Cassidy and The Sundance Kid,* facing down the entire Bolivian army, may be coming to mind. Why not start off among friends and see what happens? Contesters are always looking for more participants. Finally, commit yourselves to participating in one of the contests. Even if it's only for a few hours on just one afternoon. I'll bet you'll be surprised as to how much fun you and your friends can have in a single afternoon.

Grid Squares and Exchanges

Baseball has diamonds, football has a gridiron, soccer has a pitch, and VHF/UHF contests are played on grid squares. What is a grid square? The entire world is divided into grid squares. Grid squares in the Maidenhead Locator System are actually rectangles, approximately 70 x 100 miles (*Photo A*). There are a number of good grid square websites. One of my favorites is the HA8TKS website <https://tinyurl.com/yw7vm8rw>. This website allows you to

Photo D. A tow boat on the Mississippi River near Lock and Dam 25. Actually, tow boats push barges rather than tow them.

focus on the grid squares near your location (QTH).

Grid squares have a two-letter designator along with two numerals. For example, my QTH of St. Peters, Missouri is located in grid square EM48. HA8TKS's website even narrows the resolution down to an additional two letters, so my QTH is EM48qs. The extra letters can prove to be useful for refining azimuth headings between grids. Major roads and towns are included with this computer-generated grid square map. For determining my grid square while I am out and about, I use my Android cell phone and free apps such as Ham GPS, Easy QTH Locator, and QTH Locator.

Most grid square calculating programs allow users to not only find their exact location in the Maidenhead Locator System, but will also calculate the azimuth (beam heading) and distance to another grid location, a very useful feature… especially when figuring out location headings and distances using directional antennas and a compass.

VHF/UHF contests require your on-the-air exchange to include callsigns

Photo E. My dual-band loop antenna with magnetic mount. This antenna has a single feedpoint, and it covers 2 meters and 70 centimeters. It is horizontally polarized.

Photo F. Harry, WAØCNS, in his rover van. Note his roof-mounted 144- , 222- and 440-MHz Yagis. Harry uses a rotor to aim his Yagis when he is stationary. (Photo by Herbert Ullmann, AF4JF)

and grid square location. For example, I may be contacting Herbert, AF4JF, on the air and my report may sound like, "AF4JF this is KOØZ in EM48qs, do you copy?" Herbert then would reply with his callsign and grid square.

Do Be a Square

Since childhood, we've heard, "don't be square, join the fun." In this case, I suggest you *do* become a square by finding your grid square along with neighboring ones and plan your "grid square attack." Depending on time available, level of expertise, and equipment, I suggest you look at two adjoining grid squares. If you want to go "hog wild," look at the corners where four grid squares meet. Activating two grid squares is less labor intensive than four squares and would be a good place to start; especially as a beginner to VHF-and-above contests and you lack free time.

When looking at grid squares, look for public roads, open fields, and high locations such as hilltops, etc. Check the contest rules for minimum distances. For instance, in many contests, stations within the same grid cannot be closer than 1-kilometer (km) apart. One kilometer is not far, It's only 0.62 miles. If I am in another adjoining grid square, I still use that 1-km rule if I am close to another rover (a station operating from multiple locations). HTs with rubber ducks can easily cover that short distance. In the ARRL September VHF contest, I used my Kenwood three-band HT for 222 MHz. Sure, most serious contesters use SSB or CW (Morse Code) on 222 MHz, but FM is allowed. Even if you and a few pals only have dual-band HTs, why not go to two nearby grids and activate them for points? It's all part of the grid plan attack.

Photo G. Harry Haeusser's, 1.2-GHz loop Yagi antennas along with some of his microwave gear on recent contest outing. (AF4JF Photo)

Photo H. Herbert Ullmann, AF4JF's, rover setup in a high location in grid square EM47 overlooking the Ozark foothills. (AF4JF Photo)

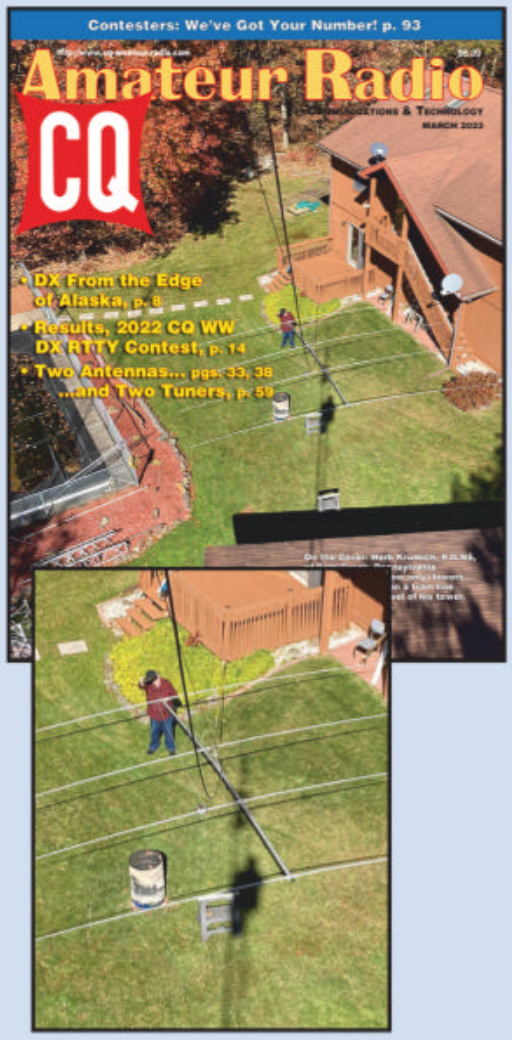
Our Plan

Rather than give a lot of scenarios, let me give you a brief overview of our grid square plan of attack in the ARRL September VHF contest. Herbert Ullmann, AF4JF; Harry Haeusser, WAØCNS; and your editor Ron, KOØZ, decided to spend a fun Saturday afternoon near Winfield, Missouri (grid square EM49). About a mile to the south is the border of grid square EM48 (*Photo B*). This is mostly farmland with gravel roads, but it is flat and there are spots along the road to pull over and operate.

Army Corps of Engineers Mississippi River Lock and Dam 25 is nearby (*Photos C* and *D*), which was a perfect setting for us to get on the air. Keep in mind, our intent is not to be "big guns" (highly competitive stations) in the contest, rather it is our attempt to have fun, to get out of the house for a little while, to activate a few grids, and to see if we can drum up some on-the-air activity other than just among ourselves.

Beforehand, AF4JF worked out the operating logistics. We met at Lock and Dam #25 in grid square EM49. Our plan was for each of us to be a rover and to activate grid squares EM49 and EM48. Harry and Herbert drove 1 km away and we worked each other on 144.200, 222.100, and 432.100 MHz in EM49. Next, Herbert and I drove a few kilometers to grid square EM48 where we both worked Harry. Harry joined me in EM48 and Herbert went to where Harry was in EM49. We worked each other again. Now it was my turn to go to EM49 so Harry and Herbert could work me from EM48 to EM49. You get the idea. Although Harry and Herbert had 222-MHz radios capable of SSB and CW, they could also operate FM. The entire

On the Cover ...



"When I took this picture from 60 feet," wrote Herb Krumich, K2LNS, "I never realized that a shadow of the tower with me on it was present." And the shadow is all you can see of Herb in our cover photo, as he lowers his 4-element 20-meter beam on a tram line to a friend on the ground. Herb lives in Bear Creek, Pennsylvania, outside Wilkes Barre in the Pocono Mountains, where he is more active on VHF/UHF and microwaves than on the HF bands.

Licensed since 1958, Herb – often operating with friend Andy Furlong, WA2FGK – is a longtime VHFer, active on ten bands from 50 MHz to 10 GHz, taking advantage of his 2100-foot elevation to work VHF/UHF contests as well as EME (Earth-Moon-Earth). According to Herb, his QTH was selected first for ham radio benefits, and then his home was built there. The tower whose shadow is seen in the photo is just one of six, supporting antennas for HF, 6 and 2 meters; 222, 432 and 903 MHz; as well as 1.2, 2.3, 3.4, 5 and 10 GHz. He also has a rover setup with gear for 50 MHz through 10 GHz. Herb is also treasurer of the Murgas Amateur Radio Club in Wikles Barre. More info and photos (lots of photos!) may be found on the QRZ.com pages for both K2LNS and WA2FGK. (*Cover photo by Herb Krumich, K2LNS*)

Photo I. Herbert Ullmann, AF4JF, taking aim with his 1.2-GHz Yagi.

Photo J. Check out this multiband rover antenna setup at a Central States VHF Society conference.

time, I used my Kenwood HT to activate 222.100 MHz. It fit the bill nicely. Basically, we made sure that all three of us worked each other on 2 and 1.25 meters, as well as on 70 and 23 centimeters.

Scoring

Most, if not all, VHF-and-above contests award higher point values for higher frequencies. For example, the ARRL January VHF contest awards 1 point for each complete 50- or 144-MHz QSO, two points for every complete 222- or 432-MHz QSO, four points for each complete 902- or 1296-MHz QSO and 8 points for each 2.3-GHz and higher QSO. Harry and Herbert brought 10-GHz stations with them. Unfortunately, my 10-GHz station was down for repairs. Grid squares count as multipliers; therefore, the more grids worked, the higher the score. We operated from two grids. We could have done more, but our goal was to simply get on the air and experiment with various antennas. This was my first contest as a rover and I scored over 700 points. Not too shabby, considering we were only contacting each other and having fun while doing it. Harry and Herbert had higher scores because they operated 10 GHz. Other competitive rovers in the contest made tens of thousands of points. They, too, had a lot of fun, but they rack up a lot of miles and they are constantly on the go. We decided to take a much more "laid back" approach.

Antennas

The topic of antennas is near and dear to almost every ham radio operator's heart. For the September 2022 ARRL VHF contest, I used a 2-meter and 70-centimeter loop antenna (*Photo E*) along with a 7-element 70-centimeter Yagi and 24-element loop Yagi. WAØCNS used a roof-mounted 2-meter Yagi, 222-MHz Yagi, a 70-centimeter Yagi (*Photo F*). He keeps his 23-centimeter Yagi inside his van until he is ready to use it after making contacts on the lower bands (*Photo G*). AF4JF uses a roof-mounted 2-meter, 70-centimeter horizontally polarized omni-directional antenna. In addition, he sets up his antennas for 1.2, 2.4, and 3.5 GHz as well as 10 and 24 GHz.

Don't Get Bit (Actually, Do…)

Antennas are fun. Higher frequencies translate into smaller antenna element lengths. Microwave bands allow radio amateurs to experiment with very-high-gain antennas that few HF operators have enough real estate on which to erect them. However, don't let the allure of higher gain antennas impede you from dipping your big toe into the world of VHF/UHF contesting. Simple rubber duck antennas and dual-band HTs are enough to get in on a lot of the fun. Although I used my HT only on 222 MHz, all of us could have limited ourselves to HTs and made fewer points. However, we do have transverters and this contest gave us a fun opportunity to try them out.

I must caution you. Beware, after dipping your big toe to test out the water a few times, you and your ham radio buddies may be pleasantly surprised, and you'll want to get more involved, you'll be bit and the need for longer distances and more grid squares will come calling. Soon, directional antennas and weekend roving trips will be in the offing! Check out the photo of a rover's antennas at a Central States VHF Society conference (*Photo J*). Until then, why not break out the HTs, mobile rigs, and vertically polarized antennas and activate a few neighboring grid squares. You'll be glad that you did! It will be fun to recount over the air and at ham radio club meetings the successes and near successes of each trip. You may just inspire others to join in on the fun. Success breeds success! Thank you for reading *CQ* and I hope to hear you on the air. *– 73, Ron, KOØZ*

BY TRENT FLEMING,* N4DTF

Six-Meter E_s Season Approaches

Well, this is my March column, and I always try to make a point to promote 6-meter activity. Traditionally, in the Northern Hemisphere, our strongest opportunities on 6 meters come from Sporadic-E (E_s) propagation, from April through July. But as each sunspot cycle strengthens, we begin to see opportunities for other types of propagation, including F_2 on 6 meters. Recently, some impressive propagation has been reported, which is perhaps a combination of various methods, and you may expect this to continue through most of 2023. Recently, there has been a thread on the FFMA (Fred Fish Memorial Award) email group about various modes of propagation, and I thought you would find it interesting as well. I asked Frank Donovan, W3LPL, noted contester and all-around knowledgeable ham, to comment about the types of 6-meter propagation, and he offered the following, including a link to a very nice treatment of one particular mode, Trans-Equatorial Propagation (TEP):

W3LPL Says:

The F_2 ionospheric region and the E layer support multiple modes of ionospheric propagation enabling 6-meter DX contacts between many areas of the world.

F_2 region

~ mid-latitude and equatorial single and multi-hop F_2 propagation
~ TEP
~ oblique-TEP propagation

E layer

~ single-hop E_s propagation to Bermuda and the northern Caribbean
~ multi-hop mid-latitude E_s propagation to most of the same hemisphere
~ single-hop E_s coupled to TEP and mid-latitude F_2 propagation

Sporadic-E Propagation Coupled into TEP

Very long distance 6-meter contacts crossing into and across the equatorial region usually involve E_s coupled into TEP at one or both ends of the propagation path. TEP propagation is mostly north-south and oblique-TEP propagates *either within or across* the equatorial region.

It is often difficult to identify which types of propagation contributed to our DX QSOs. We can make reasonably informed judgements about the most likely propagation modes by applying basic knowledge of how 6-meter DX propagation modes vary with:

~ time of day
~ season of the year
~ solar activity, especially as measured by the 2800-MHz solar flux index
~ F_2 and E_s properties along the entire propagation path

Until 20 years ago, the holy grail of 6-meter DXing was mid-latitude and trans-equatorial F_2 propagation mostly from November through February during the 12 to 24 months closest to solar maximum of the three strong solar cycles (19, 21, and 22) from 1957 through 2002.

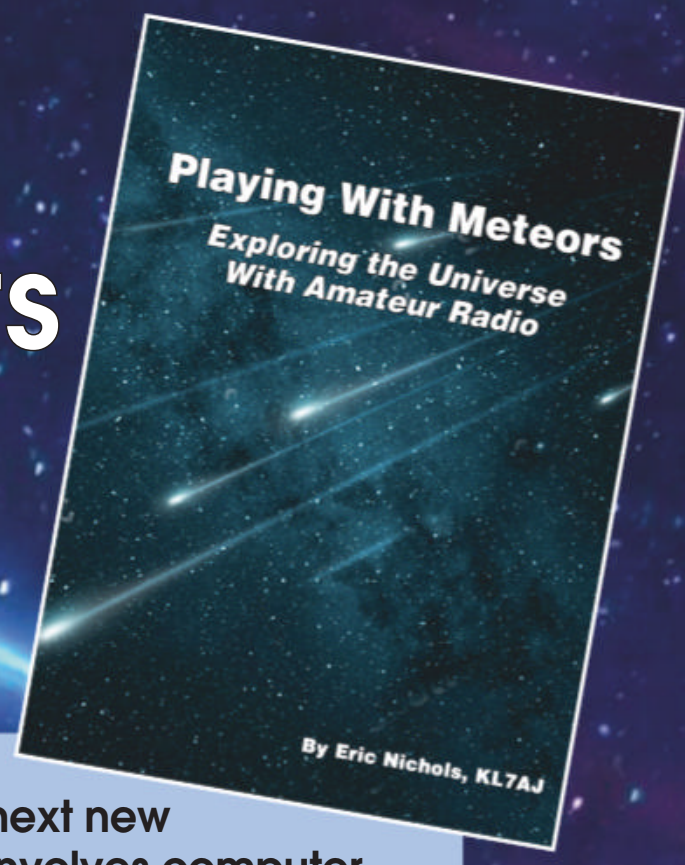
Playing With Meteors

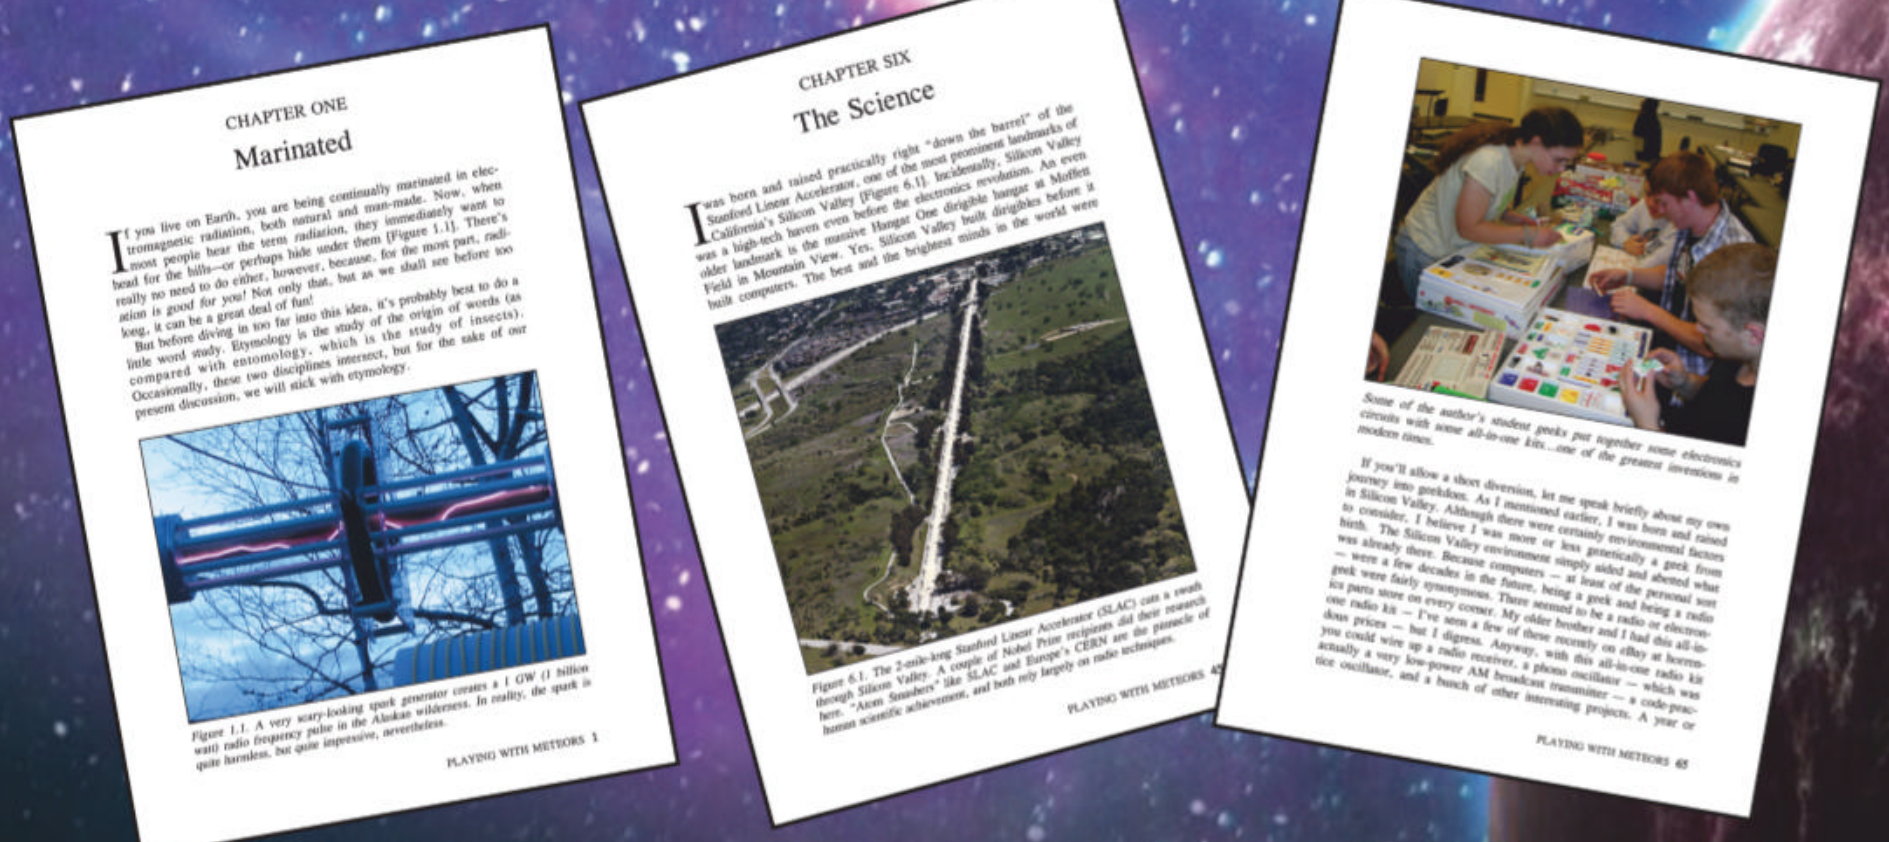
Exploring the Universe With Amateur Radio

By Eric Nichols KL7AJ



Wouldn't it be a blast to be a master of technology rather than to be at its mercy? Or better yet, to actually create the next new thing? While it's true that a lot of what we consider high-tech involves computer technology, an equal or greater part of the next new thing is going to involve wireless, also known as radio. In fact, our entire universe is connected by radio, and the entire universe is the radio amateur's sandbox.

In *Playing With Meteors*, author Eric Nichols takes you on a tour of the opportunities that amateur radio can bring you, and how you can leverage the knowledge you gain in "hobby radio" to a career in hi-tech, or just to being smarter than your "smart devices" (and maybe even some of your friends).



CHAPTER ONE

Marinated

If you live on Earth, you are being continually marinated in electromagnetic radiation, both natural and man-made. Now, when most people hear the term radiation, they immediately want to head for the hills—or perhaps hide under them [Figure 1.1]. There's really no need to do either, however, because, for the most part, radiation is good for you! Not only that, but as we shall see before too long, it can be a great deal of fun!

But before diving in too far into this idea, it's probably best to do a little word study. Etymology is the study of the origin of words (as compared with entomology, which is the study of insects). Occasionally, these two disciplines intersect, but for the sake of our present discussion, we will stick with etymology.

Figure 1.1. A very scary-looking spark generator creates a 1 GW (1 billion watt) radio frequency pulse in the Alaskan wilderness. In reality, the spark is quite harmless, but quite impressive, nevertheless.

PLAYING WITH METEORS 1

CHAPTER SIX

The Science

I was born and raised practically right "down the barrel" of the Stanford Linear Accelerator, one of the most prominent landmarks of California's Silicon Valley [Figure 6.1]. Incidentally, Silicon Valley was a high-tech haven even before the electronics revolution. An even older landmark is the massive Hangar One dirigible hangar at Moffett Field in Mountain View. Yes, Silicon Valley built dirigibles before it built computers. The best and the brightest minds in the world were

Figure 6.1. The 2-mile-long Stanford Linear Accelerator (SLAC) cuts a swath through Silicon Valley. A couple of Nobel Prize recipients did their research here. "Atom Smashers" like SLAC and Europe's CERN are the pinnacle of human scientific achievement, and both rely largely on radio techniques.

PLAYING WITH METEORS 45

Some of the author's student geeks put together some electronics circuits with some all-in-one kits…one of the greatest inventions in modern times.

If you'll allow a short diversion, let me speak briefly about my own journey into geekdom. As I mentioned earlier, I was born and raised in Silicon Valley. Although there were certainly environmental factors to consider, I believe I was more or less genetically a geek from birth. The Silicon Valley environment simply aided and abetted what was already there. Because computers — at least of the personal sort — were a few decades in the future, being a geek and being a radio geek were fairly synonymous. There seemed to be a radio or electronics parts store on every corner. My older brother and I had this all-in-one radio kit — I've seen a few of these recently on eBay at horrendous prices — but I digress. Anyway, with this all-in-one radio kit you could wire up a radio receiver, a phone oscillator — which was actually a very low-power AM broadcast transmitter — a code-practice oscillator, and a bunch of other interesting projects. A year or

Current solar cycle 25 has already recorded the strongest sunspot activity since 2002 and might develop sunspot activity similar to that which caused frequent mid-latitude and trans-equatorial F_2 propagation from November 2001 through February 2002.

F_2 mid-latitude propagation almost completely disappeared after February 2002, but 6-meter mid-latitude DXers began to capitalize on multi-hop E_s, and E_s coupled into TEP and oblique-TEP, making it possible for hundreds of 6-meter DXers to achieve 6-meter DXCC despite weak sunspot activity. In addition, the-weak signal performance and popularity of FT8 enabled 6-meter DXers to thrive without much help from sunspots.

While mid-latitude 6-meter F_2 propagation occurs for just a few months during just a few years of strong solar cycles, a form of F_2 propagation known as TEP occurs throughout the entire 11-year period of every solar cycle. A phenomenon in the F_2 region known as the *trans-equatorial ionization anomaly* occurs every day and often enhances the maximum usable frequency (MUF) of F_2 propagation that crosses the equatorial region, sometimes causing the TEP MUF to exceed 50 MHz, even when sunspot activity is very low. During strong solar cycles, the MUF of many very long-distance propagation paths exceeds 50 MHZ even without TEP ionization enhancement and E_s coupled into TEP is usually not needed.

TEP reflects from the parts of the ionosphere located from approximately 15° to as far as 25° north and south of the geomagnetic equator. In the Western Hemisphere, this ranges to the northerly enhanced F_2 ionization zone mostly over Venezuela and the southerly enhanced F_2 ionization zone mostly over northern Argentina and southern Brazil.

TEP-related propagation from mid-latitudes of North America to equatorial South America and Africa is usually via E_s coupled to the northerly enhanced F_2 ionization zone then propagating to the ground without propagating to the southerly enhanced F_2 ionization zone.

TEP usually has a weak seasonal peak in September and October and a somewhat stronger seasonal peak during April and May. During stronger solar cycles, TEP can occur during any month of the year and has a very strong peak in April and May.

See K6MIO's excellent article on 6-meter TEP, oblique-TEP, TEP-related, and mid-latitude E_s coupling to TEP begins on page 66 at: <https://tinyurl.com/26auem6n> (*Thank you, Frank, for this helpful guide to 6-meter propagation! –ed.*)

Before you worry too much about the mode of propagation, make sure you are listening and calling on 6 meters to take advantage of any openings. My standard habit is to keep a radio on 6-meter phone anytime I am in the shack (which is also my office). I generally monitor 50.125 MHz for starters, but remember that officially, 50.110 MHz is the DX calling frequency, so it is worth a listen and call occasionally there as well. I currently have a three-element beam up, so I get fairly broad coverage, but if you have more elements, and thus a more directional antenna, you may want to use a loop antenna for listening to ensure you don't miss an opening in a particular direction. Many of us locally will call or text one another if we see an opening, and the alerts from DXmaps.com are useful in identifying openings.

CW is another popular mode for 6 meters, so monitoring the CW segment is also advisable. Finally, the many digital modes available to us through WSJT-X have significantly expanded the depth of openings, and the length of the season, by allowing more contacts to be made even when conditions are marginal. Six meters is not for everyone, but many of us live and die with band openings, closings, or propagation changes. Please send along your experiences dur-

ing the upcoming E_s season, and good luck on the Magic Band!

ARRL January VHF Contest

As I write this, the ARRL January VHF Contest has just ended. I'm seeing reports ranging from dismal conditions — that was the case for me in EM55 — to outstanding. Location, times available to be on the air, and local weather conditions all played a role. In my case, it was a last-minute decision to participate, as I have dismantled my shack in an attempt to create a much better space for my shack, office, and workshop. More on that later. But I got my 9100 hooked up, and had 6 meters, 2 meters, and 432 MHz available. I made no contacts on 6 meters, two on 2 meters, and none on 432 MHz for a total operating time of approximately 4 hours.

I wanted to share the adventures of a couple of rovers, those brave souls — especially in the north during January — who ventured out into the elements to give us a chance at multiple grids and bands, while we stayed inside our comfy shacks.

Ken, K2ET, made his first rove in an electric vehicle (EV), putting nine bands on the air (*Photos A* and *B*). His excellent write up on the planning and execution of his rove is found at <www.k2et.net>.

Tony, KG9OV, made a solid effort in the Midwest, and you can check out *Photos C* and *D* for images of his mobile setup and antennas.

Finally, one of my two contacts was with Steve, AG4V, who is a regular rover out of the Memphis area into the mid EM grids around the MidSouth. Always great to hear Steve on the air.

In the Shack at N4DTF

As previously mentioned, I am reworking my combination office, hamshack, and workshop. It's too early for pictures, but I will give you some insight into my thoughts and planning. The space in question is a typical two-car garage, roughly 25 x 25 feet square. My effort here is to improve and enhance the use of each of my three areas.

First, the office. I have plenty of space for my work, and thanks to a concerted effort to reduce paper, I need less and less storage space. In addition, while I still do a lot of live speaking engagements, I'm receiving more requests for video presentations, and it seems like almost every conference call these days is a video call. So, I'm adding better video and sound capabilities as well as a backdrop to improve the professionalism of the scene projected.

On the workbench side, my workspaces are currently too scattered, so I plan to implement a solid bench space along most of the two walls to provide better access to various tools and test equipment, and more counter space to work on. This includes everything from a drill press to electronic test equipment to a reloading bench. Finally, with the ham shack, I needed more space to have proper access to a high frequency (HF) rig, a VHF and above setup, and a boat anchor station comprised of a Hallicrafters Cyclone, HT-41 amplifier, and SX-101a receiver. This will be accomplished with a larger desktop — 70 x 30 inches instead of 48 x 24 inches — and some shelving. One of my main goals here is to open the back of the operating desk for easy access to cables and connections. So, the desk will come out perpendicular from the wall, under a window, which has the appropriate pass-through connections, and be fully accessible in an "alley" bordered by bookcases. One of the first steps I've taken is to put all my existing benches and tables on wheels, to allow for easier arrangement, and possibly moving them again, because who doesn't eventually decide they need to change things up? *Photo E* shows my temporary operating position on a folding table for the VHF contest. The SX-101a is there for moral support. Or because I don't have anywhere else to put it right now.

That's all for this month. Please stay in touch and let me know about your on-air activities and ham shack projects.

We set up four tents on the island but on the third night, we had an aggressive storm with winds over 35 miles per hour, which completely destroyed one tent. We then had to install a backup tent that was brought along "just in case."

The tiny volcanic sand particles blown by the wind often ended up inside our reliable Furman 8-killowatt power generator, causing it to stop. Fortunately, Tim's keen mechanical skills always came to the rescue and he would quickly have the generator back in service and our stations once again QRV. We also had a small Honda 2-kilowatt generator as a backup but we didn't need to use it much.

The Icom and Elecraft radios were used mainly for CW and SSB operating. The SunSDR2PRO transceivers did a great job running the FT8 pileups.

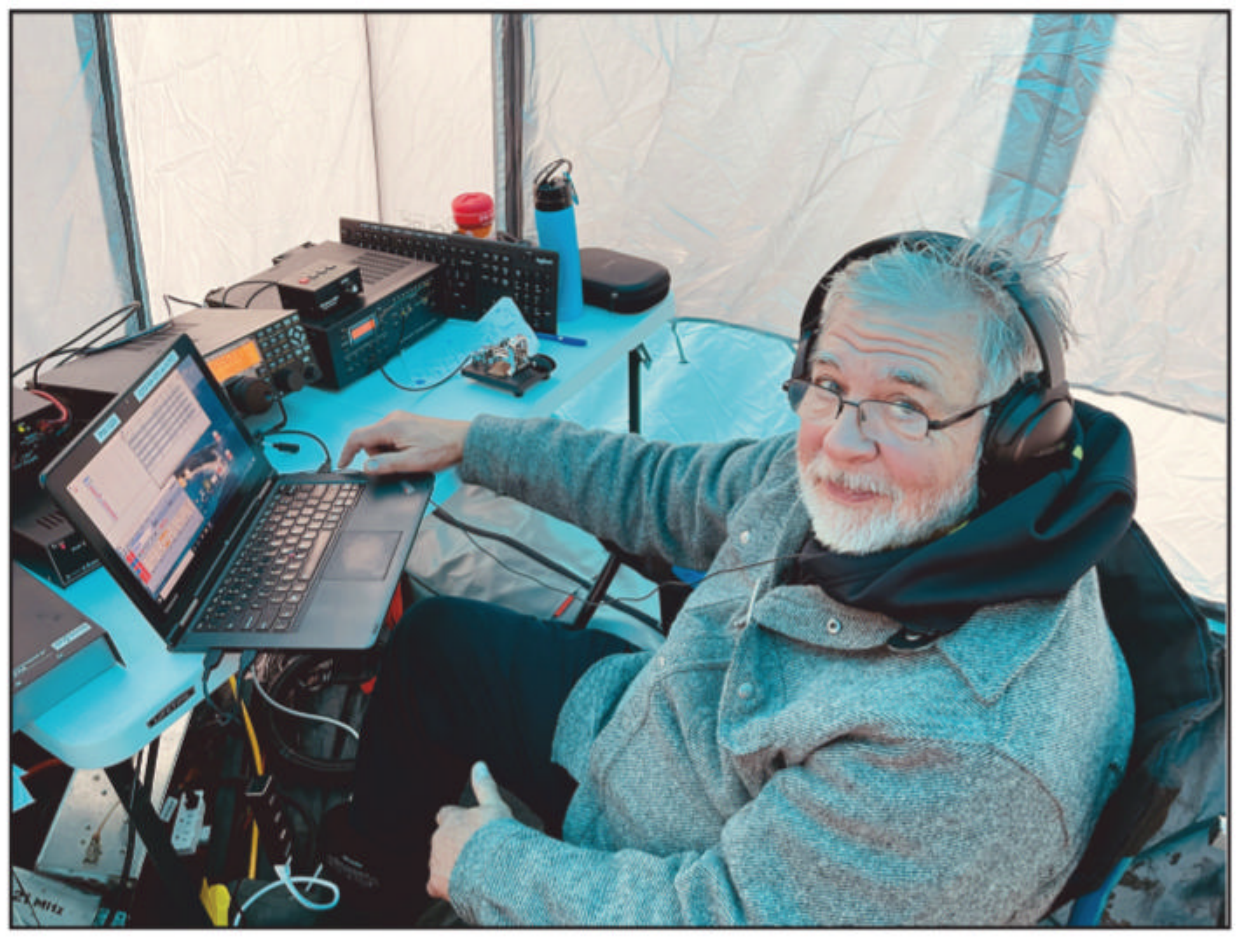
Antennas:
17-meter VDA
CrankIR multiband vertical from SteppIR
Spiderpole 40/30-meter vertical
Hustler 6BTV vertical
Cushcraft R7000 vertical

Radios:
1 X Icom IC-7610
1 X Elecraft K3S
3 X SunSDR2Pro

Amplifiers:
1 X Expert 1.3 kilowatts
2 X Juma PA-1000 1 kilowatt
1 X Ameritron ALS 600S

Gas powered generators:
1 X Honda 2 kilowatts
1 x Furman 220V 8 kilowatts

Adrian, KO8SCA, operating CW.



Hal, W8HC, operating CW.

Life on the Island

Of course, most of our time was spent operating and we tried to keep three stations operational at all times, with one on each mode: CW, phone, and FT8. There were many times, especially as we were trying to work Europe, that it was nearly impossible with phone and we would switch to FT8. Outside of operating, time was spent working on the antennas, securing the tents, sightseeing at this incredible island, and eating.

There were cases of Mountain House "Adventure Meals" that are basically a meal in a pouch ... just add hot water, stir, reseal the pouch, and wait a few minutes. They were actually pretty good!

Yuri and James had arranged to bring an assortment of meats — from headcheese to sausages and "tushenka" (broiled canned meat with spaghetti)

But we were in for a nice treat one late afternoon when Captain Rick radioed over to us asking Alex to bring the Zodiac out to April Lane. He said he had dinner ready for us. And indeed he did. Rick had prepared a near gourmet meal in the be boat's galley and Alex returned to the beach as we anxiously pulled in the skiff so we could help take this Grub Hub-on-steroids meal for the K7K team to savor. Rick cooked us "home" fried chicken, scalloped potatoes, fresh salad and, for dessert, homemade chocolate cake with vanilla frosting. He also sent over a half gallon of milk and a "Black Box" of Chardonnay wine. Needless to say, our QSO rate went to zero while the

team convened on the beach to enjoy our first and only "home-cooked" meal on Kiska.

The Hardest Part

Captain Rick kept a close eye on the weather reports he received onboard the boat and would radio us with news of any impending storms and strong winds. We had already lost the one tent and we didn't have any "spares."

The day before we were to depart, Rick radioed us and said the weather forecast for Kiska included a bad storm coming later that night but would be clearing up mid-morning. He said the weather would be good for about six hours, then another storm front would follow. That evening and night the winds and rain became pretty intense. At several times during the night, Hal said he was afraid the operating tent with him and Tim inside felt like it was going to blow away.

In the morning, there was no sign of the "break" Captain Rick described but the team began the task of tearing down K7K city, stations and antennas, and taking everything to the beach. The breakers on the beach were running about 3 feet so would have to wait to ferry our stuff out into the harbor and back onto the April Lane. We didn't keep count, but I would guess that getting everything onto and off Kiska Island required about 20 trips in the Zodiac.

By late morning, just as the weather forecast predicted, the winds calmed, the rains stopped and the sun actually came out, so we proceeded to take advantage of this "window" and start taking everything back to the boat. Alex once again was the designated Zodiac driver and did a fantastic job piloting the skiff off the beach and beyond the breakers. Most of us did get wet making the crossing. We also had a few occasions when Tim had to work his magic on the 5-horsepower outboard motor. There were some tense moments that had us holding our breaths when the motor would stop in the middle of the harbor and Alex would have to get the paddle out and manually paddle back to the boat or shore to bring the motor back to life. It seems that the black volcanic sand was finding its way into the motor's cooling water system, causing it to shut down. But finally, after nearly four hours of loading and unloading the Zodiac, we had everything off the island, back on the boat, and loaded into the eight totes lashed to the April Lane's afterdeck. All of us were dog tired but happy to be safely onboard. Clean, dry clothes were the first order of business once on the April Lane.

Lessons Learned

There is no doubt we took too much food with us. In truth, we probably had enough to sustain us for a month or longer. It

5 Band WAZ

As of January 15, 2023
2439 stations have attained at least the 150 Zone level, and 1112 stations have attained the 200 Zone level.

As of January 15, 2023
The top contenders for 5 Band WAZ (Zones needed on 80 or other if indicated):

Rules and applications for the WAZ program may be obtained by sending a large SAE with two units of postage or an address label and $1.00 to: WAZ Award Manager, Jose Castillo, N4BAA, 6773 South State Road 103, Straughn, IN 47387. The processing fee for the 5BWAZ award is $10.00 for subscribers (please include your most recent *CQ* mailing label or a copy) and $15.00 for nonsubscribers. An endorsement fee of $2.00 for subscribers and $5.00 for nonsubscribers is charged for each additional 10 zones confirmed. Please make all checks payable to Jose Castillo. Applicants sending QSL cards to a *CQ* checkpoint or the Award Manager must include return postage. N4BAA may also be reached via email: <n4baa@cq-amateur-radio.com>.

***Please note: Cost of the 5 Band WAZ Plaque is $100 shipped within the U.S.; $120 all foreign (sent airmail).**

CQ DX Field Award Honor Roll

The CQ DX Field Award Honor Roll recognizes those DXers who have submitted proof of confirmation with 175 or more grid fields. Honor Roll lisiting is automatic upon approval of an application for 175 or more grid fields. To remain on the CQ DX Field Award Honor Roll, annual updates are required. Updates must be accompanied by an SASE if confirmation is desired. The fee for endorsement stickers is $1.00 each plus SASE. Please make all checks payable to the Award Manager, Keith Gilbertson. Mail all updates to Keith Gilbertson, KØKG, 21688 Sandy Beach Lane, Rochert, MN 56578-9604.

Box 355, New Carlisle, OH 45344 USA. Note: WPX will now accept prefixes/calls which have been confirmed by eQSL.cc. and the ARRL Logbook of The World (LoTW).

*Please Note: The price of the 160, 30, 17, 12, 6, and Digital bars for the Award of Excellence are $6.50 each.

was like this with some of our other gear and supplies as well. I think this is a natural approach — you are going on a DXpedition and if you think you need four of one thing, you will take eight. You need 20 gallons of drinking water and you take 60, etc. The "I'd rather have too much than too little" philosophy looms large in DXpeditioning. And nothing drives this point home more than when a team member himself loads, unloads, ferries, and sets up a DXpedition camp like we did at Kiska. It makes you realize maybe next time, we

Rules and applications for the WAZ program may be obtained by sending a large SAE with two units of postage or an address label and $1.00 to: WAZ Award Manager, Jose Castillo, N4BAA, 6773 South State Road 103, Straughn, IN 47387. The processing fee for the 5BWAZ award is $10.00 for subscribers (please include your most recent *CQ* mailing label or a copy) and $15.00 for nonsubscribers. An endorsement fee of $2.00 for subscribers and $5.00 for nonsubscribers is charged for each additional 10 zones confirmed. Please make all checks payable to Jose Castillo. Applicants sending QSL cards to a *CQ* checkpoint or the Award Manager must include return postage. N4BAA may also be reached via email: <n4baa@cq-amateur-radio.com>.

***Please note: Cost of the 5 Band WAZ Plaque is $100 shipped within the U.S.; $120 all foreign (sent airmail).**

should take a little bit less food and backup gear / equipment. I think we made a lot of extra work for ourselves carrying around “dead weight” we did not use.

Statistics

K7K concluded with nearly 12,000 QSOs in the log and the statistics below speak for themselves. Because of proximity and the advertising we received in Japan about our DXpedition and its 80-year Aleutian Campaign anniversary, the Japanese stations, as expected, were prevalent in our log. Europe was, of course, the hardest to work from our location but we were able to contact many European IOTA enthusiasts.

Being far from inhabited places, there was no RF noise and that allowed us to hear better than we were being heard. But being so far up north, the propagation was not as good as in the lower latitudes and we encountered many periods of time

The WPX Honor Roll

The WPX Honor Roll is based on the current confirmed prefixes which are submitted by separate application in strict conformance with the CQ Master Prefix list. Scores are based on the current prefix total, regardless of an operator’s all-time count. Honor Roll must be updated annually by addition to, or confirmation of, present total. If no up-date, files will be made inactive. Visit <https://tinyurl.com/mrxuvwvv> for current listings.

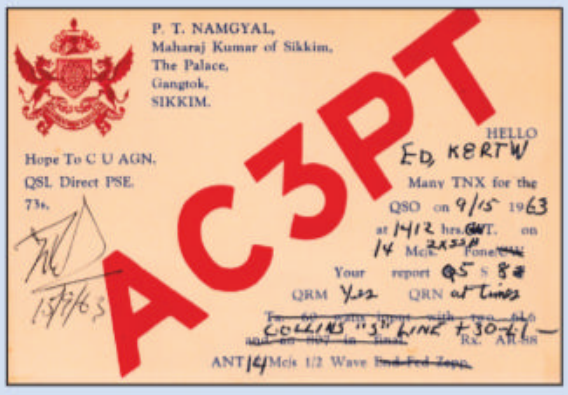
QSL of the Month: AC3PT – King of Sikkim

Here is the second installment in our new "QSLs of the Month" series, provided by Tom Roscoe, K8CX, of <www.Hamgallery.com>. Tom provides the backstories as well as the card images. We hope you enjoy seeing some very cool QSLs from the past!
– N2OO



Palden T. Namgyal, AC3PT, The Palace, Gangtok, The Himalayan Kingdom of Sikkim. This was a super rare, now deleted, DXCC entity. (QSL courtesy K8CX Ham Gallery)

Palden T. Namgyal was born in 1923 and died of cancer in 1982. In 1949 Sikkim was an independent kingdom, and Palden was the country's Maharaj Kumar, or king. He was the 12th and last official king of Sikkim. At the age of 6, he was a convent student; from 8 to 11 he studied to be ordained in the monkhood. In 1963, the king married Hope Cooke, a 23-year-old American debutante. This wedding brought much attention to Sikkim.

In 1975, Sikkim joined the Union of India, becoming its 22nd union state. There were clashes between Indian troops (who had already been in the country) and the Sikkim Royal Palace Guard.

That same year, Palden came to the U.S. to undergo cancer surgery. Due to complications from the surgery, he expired in New York City at the age of 52. His son from his first marriage was named the 13th Chogyal (king), but the position no longer has any official authority as Sikkim is now part of India.

– 73, Tom, K8CX

when propagation was marginal or nonexistent, perhaps caused by disturbances across the polar path.

Conclusion:

We thank all the sponsors: Individuals, clubs, and companies that supported us! Special thanks to U.S. FWS in Alaska! And our QRZ page <https://tinyurl.com/yazp423j> has a myriad of interesting details and pictures.

DXpeditions to the difficult area of the globe are not easy to plan or to execute. There is always the unknown element that could take you by surprise or the force of nature that men cannot tame. And there are many small details that need to fit together like the gears inside a clock to make a DXpedition a success.

And although we are relying on technology to help us, in the end it is the team of PEOPLE put together by the team leaders, the DXpedition team, who works together in unison, each member bringing to the table his or her unique skills that gets the desired end result: The sound of the pileups from a rare DX entity.

And when things don't work out as planned, you have to persevere as there is no failure except in no longer trying.

Looking Ahead

Here are some of the articles we're working on for upcoming issues of *CQ*:

- SSB Results: 2022 CQ WW DX Contest
- A Skeleton Slot Antenna for HF Through 432 MHz
- Profile: Carolina DX Association
- The Bramham Balun

Plus…

- Ye Olde Octopus Curve Tracer
- Cyrillic Morse Code

And of course…

- Professor Heisseluft!

Do you have a hobby radio story to tell? A new circuit you've designed? An operating adventure? *CQ* covers the entire radio hobby. See our writers' guidelines on the CQ website at <http://bit.ly/2qBFOdU>.

CQ's Own USA Counties Award – USA-CA

Hope everyone who attended the Orlando Hamcation® a few weeks back enjoyed seeing the new amateur radio equipment coming in 2023 and checking out that dream station they want. This month, I want to cover a CQ award that may not get the exposure or activation that it did many years ago. The USA Counties Award, or USA-CA, is one that I know about but finding a station on the opposite end working on the same award is not going to happen unless some stars align and it magically happens. Or you hook up with one of the groups / nets that's focused on helping county hunters achieve their goals. Good Luck!

The USA-CA award program sponsored by *CQ* magazine is issued for confirmed two-way radio contacts with a specified numbers of U.S. counties under rules and conditions hereafter stated. This award is not just a once and done unless you only want to earn one of the seven available classes. Did I say seven classes? Yep, seven, with the first being 500 counties and the top being all counties — 3,077 as of this writing — that county-hunters refer to as, "the whole ball of wax." At the 2,000-counties and above levels, you need to work all 50 states, while the initial 500 counties worked may be in any number of states.

Would there be any award without conditions or restrictions to make it a challenge? The award does apply to any licensed operator in the world so no worries, my fellow EU and JAs, you can achieve this award.

Something about the CQ awards is their management … every award is very well managed with very few problems ever heard or emailed to me. When I do receive an inquiry, it is passed along to the relevant award manager and gets handled in a timely manner. Rules and procedures for the award are on the CQ website at <https://tinyurl.com/ycxdmha7>, and are reproduced below with a link for a complete list of counties by state, too … enjoy.

Complete Rules — The CQ USA Counties Award (USA-CA) Program

A. Award Classes

The USA Counties Award is issued in seven different classes, each a separate achievement as endorsed on the basic certificate by use of special seals for higher classes. Also, special endorsements are made for all one band or mode operations, subject to the rules.

Class	Counties Required	States Required
USA-500	500	Any
USA-1000	1,000	25
USA-1500	1,500	45
USA-2000	2,000	50
USA-2500	2,500	50
USA-3000	3,000	50
USA-3077	ALL	50

*Email: <KI4KWR@cq-amateur-radio.com>

B. Conditions

1. USA-CA is available to all licensed amateurs everywhere in the world and is issued to them as individuals for all county contacts made, regardless of calls held, operating QTHs, or dates. Special USA-CA awards are also available to shortwave listeners (SWLs) on a heard basis.

2. All contacts must be confirmed by QSL, and such QSLs must be in the applicant's possession for identification by certification officials. Electronic verifications from sources approved by CQ are acceptable. A list of acceptable online sources may be found at <https://tinyurl.com/yyzjzwur>. (*As of now, the only electronic confirmations acceptable for USA-CA are from eQSL.com. – ed.*)

3. Any QSL card or other confirmation found to be altered in any way disqualifies the applicant.

4. QSOs via repeaters, satellites, and phone patches are not valid for USA-CA. QSOs using remote station technology are permitted, provided that all contacts are made over a direct RF path between the remote station and the station contacted.

5. So-called "team" contacts, wherein one person acknowledges a signal report and another returns a signal report,

while both amateur callsigns are logged, are not valid for USA-CA. Acceptable contact may be made with only one station at a time.

C. County Identity

1. Unless otherwise indicated on QSL cards or in an electronic confirmation database, the QTH printed on cards or entered an electronic confirmation database profile will determine county identity.

2. If no county name is provided by the contacted station, an online city and ZIP code search may be conducted to determine the county of contact.

3. For mobile and portable operations, county information stated on confirmations is the only acceptable proof of county identity.

4. In the case of cities, parks, or reservations not within counties proper, applicants may claim any one of the adjoining counties for credit (once).

D. Administration of USA-CA Program

1. The USA-CA program is administered by a CQ staff member acting as USA-CA Custodian, and all applications and related correspondence should be sent directly to this person's QTH.

2. Decisions of the Custodian in administering these rules and their interpretation, including future amendments, are final.

E. Record Book and Bookkeeping

1. The scope of the USA-CA Award makes it mandatory that applications be submitted in a specific format. Contacts must be arranged alphabetically by state and then alphabetically by county within each state. Information provided for each contact must include callsign, date of contact, band and mode, in that order. Computer-generated lists must be in a tabular format with separate columns for each field listed above.

2. A completed USA-CA Record Book (as available) or computer-generated listing of qualifying contacts constitutes the medium of basic application and becomes the property of CQ for record purposes. On subsequent applications for either higher classes or for special endorsements, the applicant may use additional Record Books to list required data, or he or she may make up alphabetical lists conforming to requirements.

3. Record Books are not currently in print, but existing copies will be accepted for all applications. At such time that Record Books may again become available, these rules will be updated and notification will be published in *CQ* magazine.

F. Application

1. Make Record Book or computer-generated list entries necessary for county identity and enter other log data necessary to satisfy any special endorsements (band / mode) requested.

2. Have two licensed amateurs (General Class or higher) or an official of a national-level radio organization or affiliated club certify that QSL cards or acceptable electronic confirmations for all contacts as listed have been seen. The USA-CA Custodian reserves the right to request any specific cards (or other confirmations) to satisfy any doubt whatsoever. In such cases, the applicant should send sufficient postage for the return of cards by registered mail.

3. Send the original completed Record Book (not a copy) or computer-generated listing, along with certification forms and handling fee to Brian Bird, NXØX, 4567 Caribou Lake Road, Duluth, MN 55811-9607. Fee is $6.00 U.S. for *CQ* subscribers (subscribers must include a copy of a recent CQ mailing label), and $12.00 U.S. for non-subscribers. Applicants outside the United States must include an additional $6.00

U.S. for postage if a certificate is requested. For later applications for higher class seals, send Record Book or self-prepared list per rules and $1.25 U.S. For application for later special endorsements (band / mode) where certificates must be returned for endorsement, send certificate and $1.25 U.S. for handling charges ($6 U.S. for stations outside the United States). Note: At the time any USA-CA Award certificate is being processed, there are no charges other than the basic fee, regardless of the number of endorsements or seals; likewise, one may skip lower classes of USA-CA and get higher classes without losing any lower awards credits or paying any fee for them. Fees may be paid by check or money order payable to Brian Bird, or via PayPal. Applicants qualifying for the USA-CA All Counties Award (3,077 counties) have the option to purchase a plaque. Contact the award custodian for details.

4. Computer-generated contact lists, certification and witness documents must be sent on paper or by email, along with the appropriate fee, to the Award Custodian (address above), not to the CQ offices. Emailed applications may include an attached file in spreadsheet or other tabular format. and must include a listing of all claimed contacts, in alphabetical order by state, and by county within each state.

The USA-CA Award Program is sponsored by *CQ* - The Radio Amateur's Journal, P.O. Box 1206, Sayville, NY 11782. Questions? Send email to Brian Bird, NXØX, USA-CA Award Manager at <nx0x@aol.com>.

USA-CA Trivia

~ The USA-CA award was inaugurated by CQ in May 1961.

~ The first award custodian was Clif Evans, K6BX

~ *CQ*'s Awards column (the one you are reading now) originated in July 1961, as the USA-CA column, written by K6BX. The USA-CA column transitioned to today's more broadly based Awards column in July 1967.

We've Got Your Number (But is it Right?)

Tips on Correctly Copying Serial Numbers in Contest Exchanges

The last weekend in March and May each year, approximately 10,000 stations will be sending and copying serial numbers as the required exchange in the 48-hour CQWW WPX SSB and CW contests. Dozens of other contests use serial numbers, too, either as a standalone exchange or — as in ARRL Sweepstakes — as a variable part of a longer exchange.

How hard is it to copy a serial number correctly? In the log checking reports for almost 2 million QSOs logged in the 2022 CQWW WPX SSB contest, serial numbers were miscopied at a 3.0% rate; while callsigns were busted only about half as often, at a 1.6% rate. From a purely information-theory analysis, one might think that copying a serial number correctly would be easier than copying a callsign. After all, a callsign is often six characters, and each character in the callsign could be either a letter or digit, making 36 possible choices for each character. Serial numbers used in ham contests are shorter — four digits or less – and only made up of the 10 possible digits.

Contesters have a couple trick up their sleeves to copy callsigns more accurately. Foremost, a station calling CQ gives its callsign over and over on the same frequency, and this is a constant; contrasted with the ever-changing serial number. Assisted entrants going search-and-pounce may be able to verify a callsign with a spot on the same frequency coming in through a post to a Telnet cluster. The most effective CQing stations are making use of Super Check Partial — a dictionary of the most common callsigns — and are familiar with the most common domestic and DX callsigns heard on the air, to help them piece together callsigns through QRM and QRN.

But perhaps more than all the above, the WPX contest rules (like many big contests) have very different scoring policies for miscopied callsigns than for miscopied exchanges. An incorrect exchange leads to the loss of credit for that one QSO; a busted callsign not only results in losing that QSO, but also carries a point penalty of two additional QSOs. Savvy contesters pay heed to the rules and work much harder to avoid miscopying the call than the exchange.

We can break down the 3.0% of miscopied exchanges into five large groupings of categories. **Extra** digits are copied in 0.4% of exchanges, and digits are **dropped** by the receiver 0.6% of the time. Two adjacent digits in the serial number are transposed about 0.1% of the time; 1.4% of the time, only a **single digit was copied incorrectly**. The remainder of busted exchanges (0.5%) have more complex error syndromes. Let's go through some strategies for avoiding the most common of these mistakes.

A strategy to reducing **extra** or **dropped** digits begins with an awareness of what "typical" serial numbers are being exchanged in that phase of the contest. If you're starting late — Sunday afternoon — and sending very low serial numbers, you'll be frequently asked for serial number repeats by those who are used to copying much larger serial numbers. If you're in the opening minutes of the contest, you'll be suspicious of numbers much larger than 100; if someone says "13, 13" they likely are repeating the number 13 twice, rather than sending the number 1313.

Digit Sent	Thousands of times busted	Most commonly busted to
0	1.3	2
1	1.6	4
2	4.5	3
3	3.7	2
4	2.6	2
5	2.3	9
6	2.6	8
7	1.2	0
8	1.8	6
9	1.8	5

Table 1. The single-digit miscopy rate for the digits 0-9 in CQWW WPX SSB 2022, and the most likely bust for each digit. Data compiled from 2.074 million QSO records in the 2022 CQWW WPX public logs.

When sending your exchange, one technique for making plain the magnitude of your serial number and ensuring your QSO party knows the correct number of digits, is to give it including "thousand" and "hundred." For example, when giving the serial 2121 I might voice "Two thousand one hundred twenty one" and avoid any possible confusion with the serial number 21 being repeated twice.

Table 1 shows the most common **single-digit copying** errors made in CQWW WPX SSB 2022 logs. The most commonly miscopied digit was "2", with "3" close behind, and this pair was most commonly mistaken for each other. The leading "t" and "th" sounds of these two digits are very similar, especially after passing through the restrictive SSB voice bandwidth, so we must depend on the trailing vowel sound "oo" or "ree" to carry the difference.

Another common bust pair seen in *Table 1* is mistaking 5 for 9 and the reverse. The vowel sounds in "five" and "nine" are very similar. A common convention in aviation radio — ICAO convention, in fact — is to say "niner," giving an extra syllable to help differentiate these two digits in numeric communications. A complete list of ICAO numeric digit recommendations is online at <https://bit.ly/3HIe8db>. I can't say I've ever heard "five niner" in giving the 59 signal report.

In **especially difficult QRM or QSB**, when asked for a repeat of the serial number, it often makes sense to give it twice. I

email: <n3qe@cq-amateur-radio.com>

First Digit	% WPX SSB Occurrence
1	32%
2	17%
3	12%
4	9%
5	8%
6	7%
7	6%
8	5%
9	5%

Table 2. The first digit of serial numbers copied in the WPX Contests are observed to closely follow Benford's Law, with "1" being by far the most common first digit.

like to include the word "number" before and between repeats; i.e. I'll pronounce "number three six seven number three six seven." It's not necessary to again give the 59 signal report when asked for a repeat; in fact, those two digits may end up confusing the receiver into thinking they are part of your serial number if you give them during each repeat.

You may notice some **apparent irregularities in serial numbers** while you are waiting in a pileup to get through to a prolific station during the busiest hours of the contest. He may give the 1210 to one caller, then the number 1212 to the next caller. Is he skipping numbers? No, but he is using advanced Single Operator Two Radio (SO2R) techniques to work stations on a second band. He gave the intervening number 1211 to a station on a different band.

A follow-on from this is that you can't assume that because the previous station was given 1212, that your QSO will

be number 1213. “Listening ahead” to get the first couple digits is fine, but be completely prepared to copy a serial number that that may be one or two higher than the most direct numeric increment.

Another odd pattern you may notice is that you work a loud station a few hours in on the first night on a low band and he gives you the serial number 312. The next morning you work the same station on a high band, and he gives you the number 65. Should you try to get a correction to the previous night’s serial number, as it appears to be out of sequence? No, you just worked a Multi-Two or Multi-Multi station that uses independent serial number sequences on each band, each band starting with 1.

The WPX contest, like nearly all modern contests, does not give a penalty for duplicate contacts. Still, you will likely run across a station or two that, even though he is not in your log, tells you are a dupe and refuses to work you again. Often these stations will read back previously exchanged serial numbers from their log rather than go through another QSO with new serial numbers. If you run across this, it’s often most productive to take note of the station that claims you’re a dupe and simply avoid calling that station again in the contest or at least on that band. Efficient stations simply work apparent dupes with a new set of serial numbers, rather than insist on a possible correction of logs — a process that is tedious, as it takes longer than simply working the apparent dupe again, and certainly more error-prone.

The challenge of copying a completely variable and unpredictable exchange element in WPX can be key to important decisions affecting your accuracy and rate. If you are having

difficulty copying a caller's callsign, that's a very strong hint that you'll also find it difficult to copy his serial number. You might encourage him to try again later when conditions are more favorable. This factor weighs even more heavily in contests with much longer and complex exchanges, such as the ARRL Sweepstakes.

In the 2022 CQWW WPX SSB contest, several stations were consistently giving **serial numbers one higher, or one lower**, than what their log showed they had sent. These stations were not interpreting the visual clues given by their loggers, as to what serial number belongs to the current QSO. *Figure 1* shows how color-coding of past vs. current serial numbers works in the popular N1MM+ logger. At the top, you'll see that I'm getting ready to work WX3B, I've typed his callsign into the left part of the entry window, and I'm seeing the number "100" in the "SntNR" box where the number I'll send is read from. But note, that the digits of SentNR are greyed out; this is a clue from my logging program that 100 was the serial number of my previous QSO. At the bottom, you'll see that only after I tab over to the RcvNR field do I get the serial number I should send, 101, and it is not greyed out. Several multi-op organizers make a policy of discussing the proper way of reading the current serial number out of their logging program, and they have noted to me that operators that insist on writing callsigns and serial numbers on paper before entering them into the computer are most likely to make patterns of serial-number-off-by-one exchanges. If you're a visiting operator at a multi-op, and aren't familiar with the clues given by the logging software in use, I strongly advise doing some research on exactly how to read the correct serial number.

After several years of WPX entries, I noticed that the serial numbers I was copying seemed to **most commonly begin with the digit "1"**. This property has been noticed for many other large data sets. In 1938, physicist Frank Benford researched this phenomenon by tabulating the leading digits given in several diverse and readily available data sets, including the house numbers in street addresses, molecular weights tabulated in chemical handbooks, and the surface areas of rivers worldwide. This property of "1" appearing most commonly as the first digit in a wide variety of data sets is called **Benford's Law**.

I tabulated the first digits of serial numbers sent and received in the 2022 CQWW WPX SSB public logs in *Table 2*. Note that "1" as the first digit occurs for almost one-third of serial numbers; at the bottom of the table, "9" as the leading digit occurs only one-sixth as often. The frequency of leading digits in WPX is a close match to the theoretical prediction of Benford's Law. Benford's Law is applicable in this case because WPX serial numbers span four orders of magnitude and everyone in the contest starts with serial number 1. Note that this principle is not applicable to the last digit of a serial number, which will be equally distributed from 0 to 9. Benford's Law is not applicable to other fixed-magnitude contest exchanges, like the check year in Sweepstakes, or the zone number in CQWW, that follow age-based or geographically-based distributions. Read more about Benford's Law at <https://bit.ly/3Rgeiff> before the next contest.

March and April Contest Highlights

A second big phone contest is also held in March: The 48-hour **ARRL DX SSB** contest is March 4th and 5th. In this contest, DX stations work U.S. and Canadian stations. Hams in the W/VE send their state or province as part of the exchange; DX stations count these per band as their multiplier. W/VE sta-

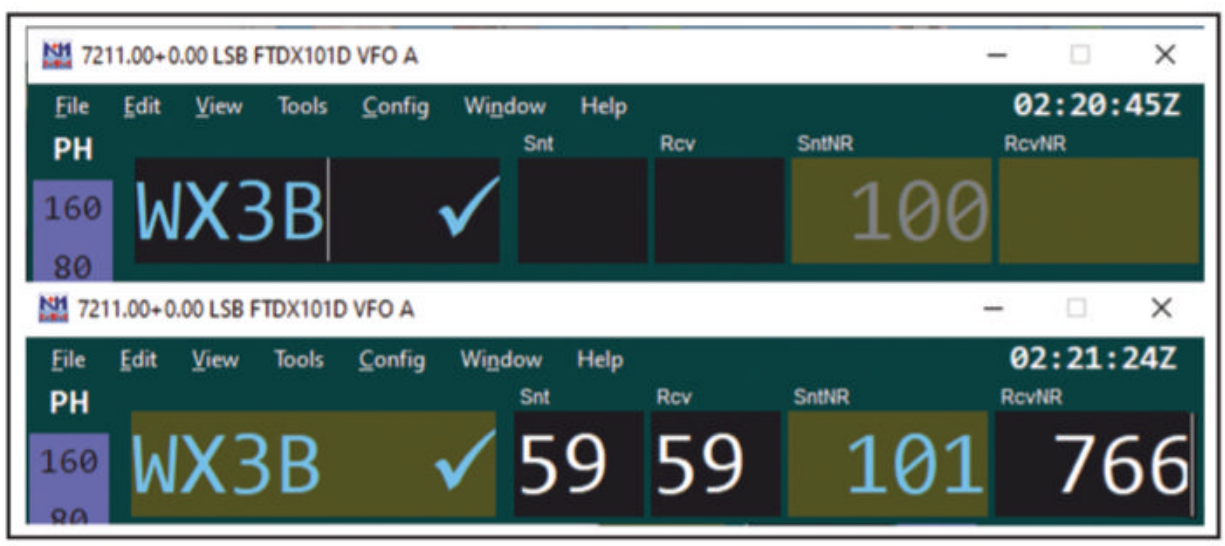

Figure 1. Top: Cursor is still in callsign box, and the serial number (greyed out) in SntNR is for the previous contact. Bottom: Cursor has been moved to the RcvNR box where a serial number was entered, and now SntNR is reading the correct serial number to send for this QSO.

tions count DXCC entities per band as their multiplier, and copy the transmitter power sent by the DX. While the most commonly heard transmitter powers heard as DX exchanges this weekend are "100 Watts," "400 Watts," and "Kilowatt," be prepared to copy oddball numbers like "99 watts" and of course QRP stations will be sending a number of "5 watts" or less. Find the full ARRL DX SSB rules at <www.arrl.org/arrl-dx>.

The next weekend, starting at 0200 UTC March 11th, is the **BARTG HF RTTY** contest. Note that the sponsor, the British Amateur Radio Teletype Group, has recently set some stringent limits on the allowed frequencies for this event. Among these are a prohibition on QSOs between 14099 and 14101 kHz (requiring contesters to keep well clear of the DX beacon frequencies around 14100 kHz). Additionally, no RTTY QSOs are to be made below 3580 kHz on the 80-meter band, which I've noticed has become the "overflow" region during the world's largest CQWW RTTY and CQWW WPX RTTY contests as U.S. stations cannot transmit digital modes above 3600 kHz. Find the new BARTG band plan and full rules at <https://bit.ly/3jEqNEy>.

The first weekend of April has the **SP DX Contest**, sponsored by Polish Amateur Radio Union and the SP DX Club. Hams around the world work Polish stations, copying the one-letter province designator as the exchange; provinces count as multipliers on each band. Non-SP stations send a serial number. This contest had been cancelled in 2022 in response to the Russian invasion of Ukraine as Polish citizens mobilized to accommodate a flood of refugees. The contest starts at 1500 UTC Saturday, April 1st, and runs for 24 hours. A helpful list of Polish province multipliers are in the full rules at <https://bit.ly/3jeRMqq>.

April 29-30th is the **Florida QSO Party.** This is one of the more popular QSO parties. Rovers move around handing out multiple Florida counties, and CW contacts count for more points than SSB, highly motivating heavy CW efforts. See <https://floridaqsoparty.org> for the rules.

propagation

BY TOMAS HOOD,* NW7US

Exceeding Expectations

Quick Look at Current Cycle 25 Conditions:
(Data rounded to nearest whole number)

Sunspots:
Observed Monthly, December 2022: **113**
12-month smoothed, June 2022: **81**

10.7-cm Flux:
Observed Monthly, December 2022: **148**
12-month smoothed, June 2022: **123**

One Year Ago:
(Data rounded to nearest whole number)

Sunspots:
Observed Monthly, December 2021: **69**
12-month smoothed, June 2021: **28**

10.7-cm Flux:
Observed Monthly, December 2021: **87**
12-month smoothed, June 2021: **103**

As we pointed out before: One recent study suggests that Cycle 25 could be one of the strongest since record keeping began. Look at the progress of the cycle in *Figure 1*. The latest 10.7-cm Radio Flux for the month of January 2023 was 182.5, much higher than the predicted 100.4. Clearly, we are witnessing a much stronger cycle than predicted.

March Shortwave Propagation

March is one of the optimal DX months. As the spring equinox approaches, the gray line begins to run straight North and South. With the return of sunlight to the polar north, the higher high-frequency (HF) bands are quickly improving over conditions we witnessed during winter.

Ten meters will be a strong worldwide DXing band, with the most reliable propagation along north-south paths, plus strong but shorter openings occurring between stations on east-west paths into Asia and Europe. These paths will quickly disappear as we move into April, so don't miss out.

Twelve and 15 meters will be even more usable than the 10-meter band. We will find 15 meters staying open longer into the evenings, being the band of choice as we move through the month and into April. Daytime paths will not degrade much until midsummer. You will see more early closures if you live closer to the North Pole.

Seventeen and 20 meters will remain in good shape and both short- and long-path circuits should be reliable and solid. All nighttime paths will be wide open during March with primetime being the evening hours in the U.S. as they are sunrise hours across Russia, Africa, and both the Near and Far East. Expect a lot of short- and long-path DX into these areas of the world.

Between sunset and midnight, expect DX openings on all bands between 20 and 160 meters, with occasional openings on 15 and 17 when conditions are high or above normal. Conditions on 30, 40, 60, 80, and 160 meters should favor openings to the east and south. These bands should peak for openings to Europe and Africa near midnight.

From midnight to sunrise, expect optimum DX conditions on 30, 40, 60, 80, and occasionally, 160 meters. Conditions should favor openings toward the west and south. Some rather good 20-meter openings should also be possible toward the south and west during this time.

Daytime MUFs continue to drop and the planetary index (A_p) is on the rise, so take advantage of the current excellent conditions, and work the world!

VHF Conditions

Check for low-VHF short-skip openings during the daylight hours. Some short-skip openings over distances of about 1,200-2,300 miles may occur. The best times for such openings are during the afternoon hours.

Auroral activity often occurs during periods of radio storminess on the HF bands. Look for days where the A_p is climbing and when the K index (K_p) reaches 4 or higher. These are the days on which VHF auroral-type openings are most likely to occur.

LAST-MINUTE FORECAST

Day-to-Day Conditions Expected for March 2023

	Expected Signal Quality			
Propagation Index	**(4)**	**(3)**	**(2)**	**(1)**
Above Normal: 1-8, 13, 15-16, 18-21, 23-31	A	A	B	C
High Normal: 9-10, 12, 14, 17, 22	A	B	C	C-D
Low Normal: 11	B	C-B	C-D	D-E
Below Normal: n/a	C	C-D	D-E	E
Disturbed: n/a	C-D	D	E	E

Where expected signal quality is:
A--Excellent opening, exceptionally strong, steady signals greater than S9
B--Good opening, moderately strong signals varying between S6 and S9, with little fading or noise.
C--Fair opening, signals between moderately strong and weak, varying between S3 and S6, with some fading and noise.
D--Poor opening, with weak signals varying between S1 and S3, with considerable fading and noise.
E--No opening expected.

HOW TO USE THIS FORECAST

1. Using the Propagation Charts appearing in "The CQ Shortwave Propagation Handbook, 4th Edition," by Carl Luetzelschwab, George Jacobs, Theodore J. Cohen, and R. B. Rose.

a. Find the *Propagation Index* associated with the particular path opening from the **Propagation Charts**.

b. With the *Propagation Index*, use the above table to find the expected signal quality associated with the path opening for any given day of the month. For example, an opening shown in the **Propagation Charts** with a *Propagation Index* of **4** will be excellent on March 1st through March 10th, good on March 11th, then excellent again the rest of the month.

2. Alternatively, you may use the *Last-Minute Forecast* as a general guide to space weather and geomagnetic conditions throughout the month. When conditions are *Above Normal*, for example, the geomagnetic field should be quiet, and space weather should be mild. On the other hand, days marked as *Disturbed* will be riddled with geomagnetic storms. Propagation of radio signals in the HF spectrum will be affected by these geomagnetic conditions. In general, when conditions are *High Normal* to *Above Normal*, signals will be more reliable on a given path, when the ionosphere supports the path that is in consideration. This chart is updated daily at <https://SunSpotWatch.com> provided by NW7US.

There are no major meteor showers during March that could provide any VHF meteor scatter propagation. For a detailed list of meteor showers, check out <https://tinyurl.com/rnfkd2d8> for a complete calendar of meteor showers in 2023.

If you use Twitter.com, you can follow <@hfradiospacewx> for hourly updates that include the K index numbers. You can also check the numbers at <https://SunSpotWatch.com>, where this columnist provides a wealth of current space weather details as well as links. Please report your observations of any notable propagation conditions, by writing this columnist via Twitter, or via the Space Weather and Radio Propagation Facebook page at <https://fb.me/spacewx.hfradio>.

Current Solar Cycle Progress

The Royal Observatory of Belgium reports that the monthly mean observed sunspot number for December 2022 is 113.1. The 12-month running smoothed sunspot number centered on June 2022 is 80.9. A smoothed sunspot count of 87, give or take about 9 points, is expected for March 2023.

The Dominion Radio Astrophysical Observatory at Penticton, BC, Canada, reports a 10.7-cm observed monthly mean solar flux of 148.46 for December 2022. The 12-month smoothed 10.7-cm flux centered on June 2022 is 122.7. The predicted smoothed 10.7-cm solar flux for March 2023 is 122, give or take 7 points.

Geomagnetic activity level this month is expected to range from quiet to stormy, resulting in occasional degraded propagation this month. Remember that you can get an up-to-the-day ***Last-Minute Forecast*** at <https://SunSpotWatch.com> on the main page.

I welcome your thoughts, questions, and experiences regarding this fascinating science of propagation. You may email me, write me a letter, or catch me on the HF amateur bands. If you are on Facebook, check out <https://fb.me/spacewx.hfradio> and <https://fb.me/NW7US> — speaking of Facebook — check out the *CQ Amateur Radio* magazine fan page at <https://fb.me/CQMag>. Also, please check out the new alternative social networking ham radio group at <https://amateurhamradio.locals.com> and please share this with your amateur radio friends and clubs. *– 73, Tomas, NW7US*

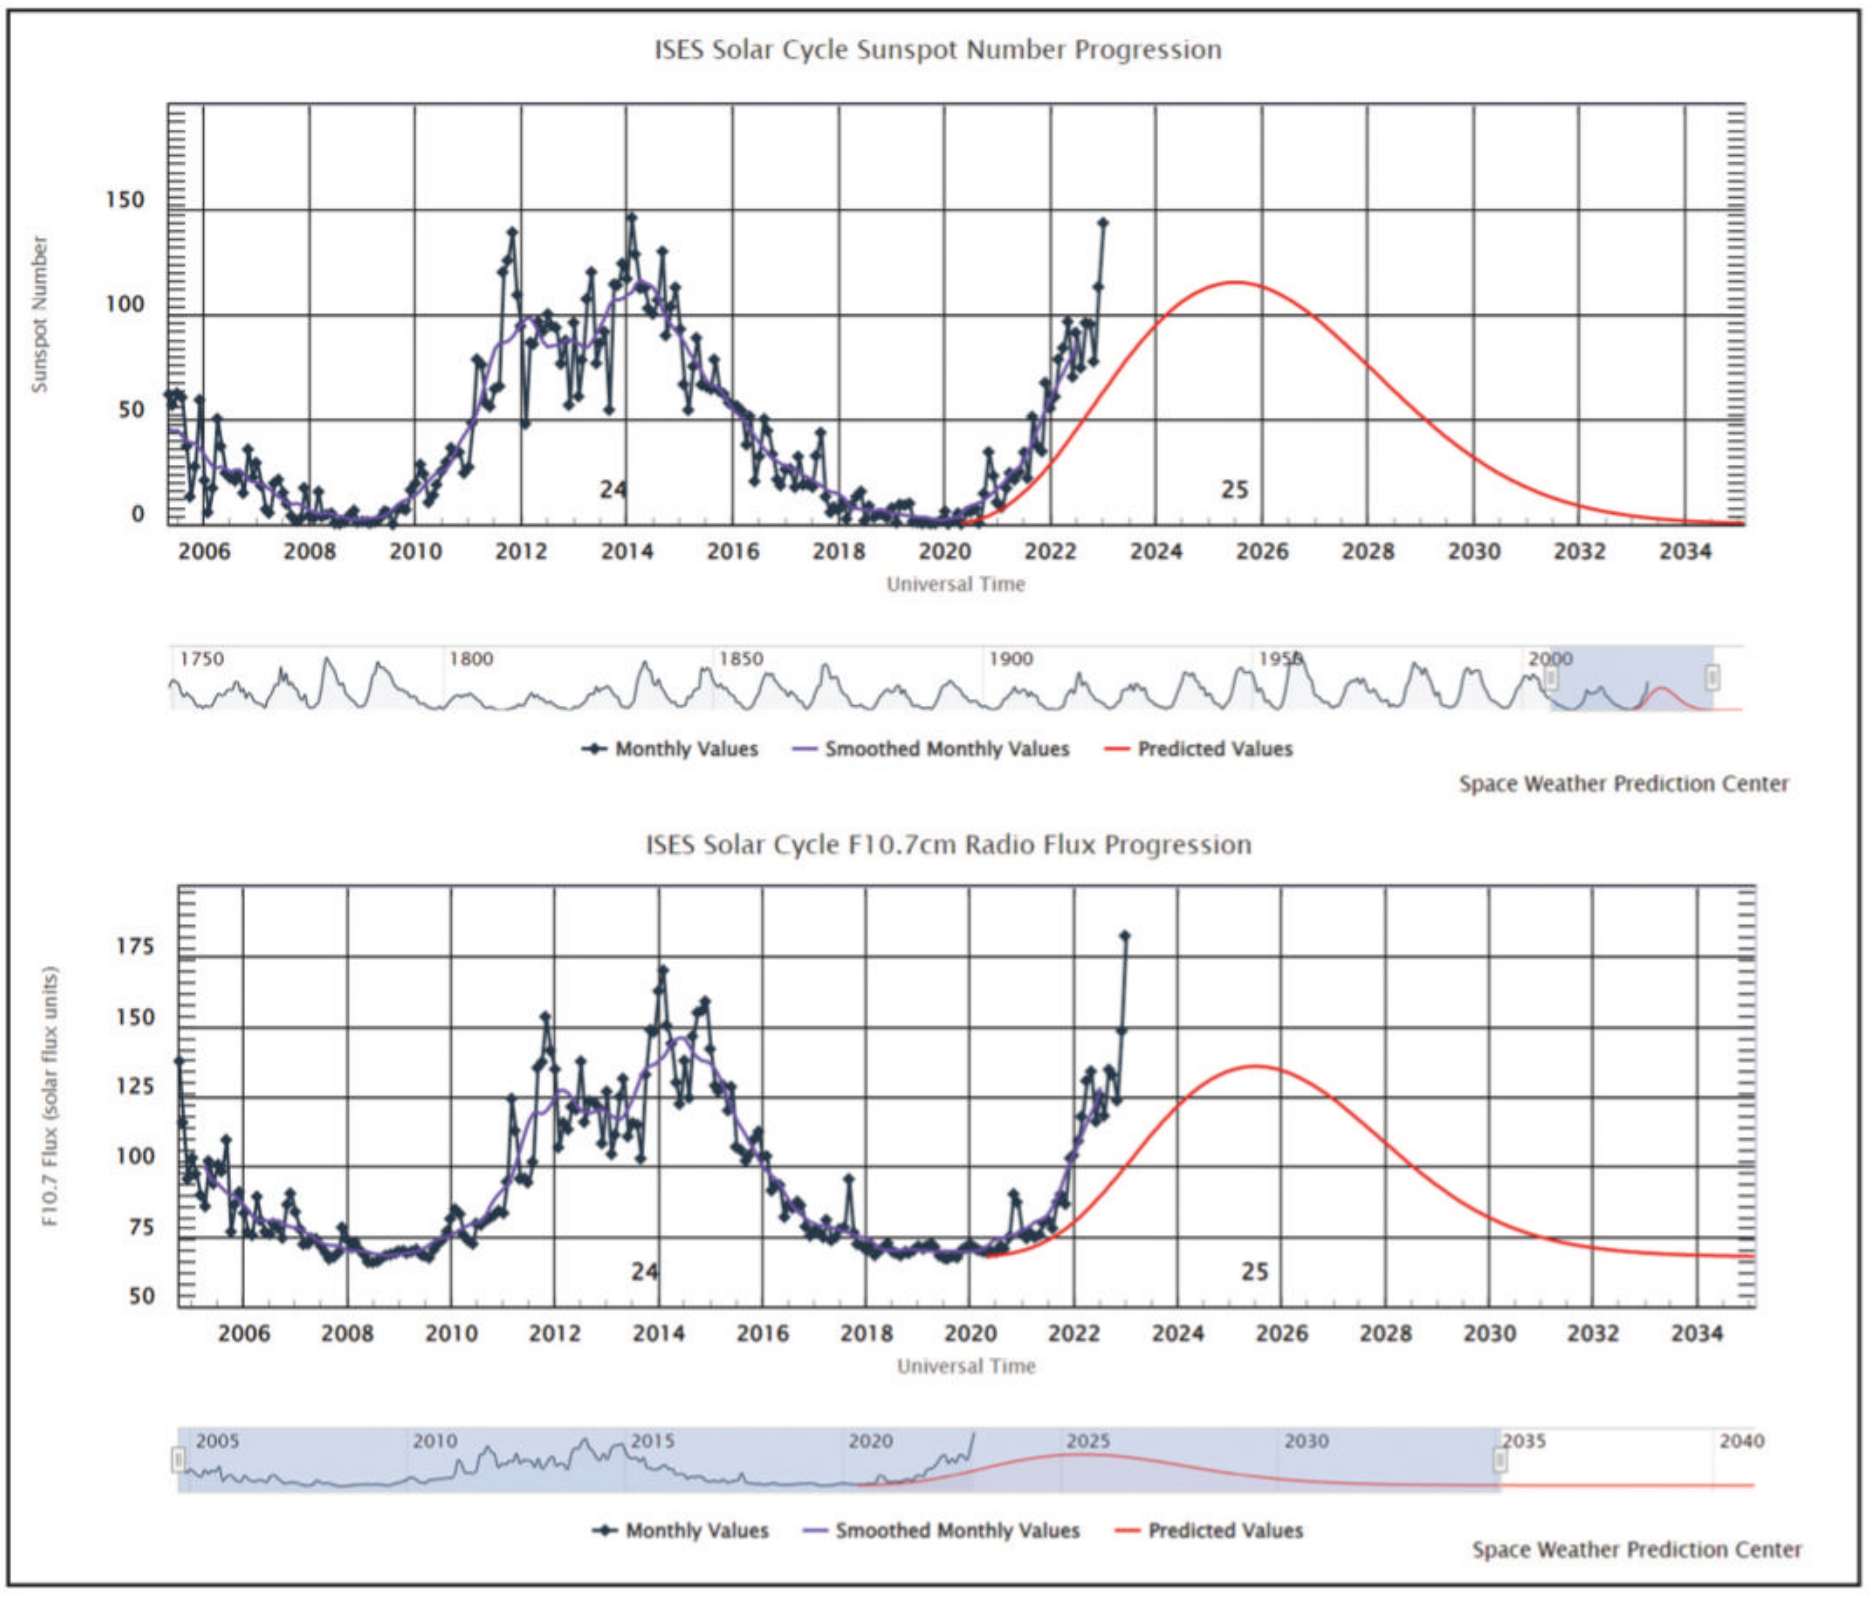

Figure 1. Cycle 25 is far outpacing the forecast! The latest monthly F10.7-cm exceeds any month in the last cycle, Cycle 24! The monthly sunspot count is also nearing the number at the peak of Cycle 24. And, we are not at the peak of this cycle, yet. We have potentially several more years to sunspot cycle peak, expected in 2025. (Courtesy of SWPC/NOAA)

announcements *(from page 92)*

a.m. to 2 p.m., Sunday, March 26 at The Hennicker Community School, 51 Western Avenue. Phone: (603) 428-3840. Email: <fest@k1bke.org>. Website: <https://k1bke.wordpress.com>. Talk-in 146.895- (PL 100). VE exams.

SOUTHINGTON, CONNECTICUT — The Southington Amateur Radio Association will hold its **Flea Market** from 8:30 a.m. to noon, Sunday, March 26 at Southington High School, 720 Pleasant Street. Contact: Bob, K1HSN, (860) 628-4808. Email: <w1cev@arrl.net>. Website: <www.chetbacon.com/sara>. Talk-in 147.345 (PL 151.4), 145.49, or 145.17 (PL 77). VE exams.

APRIL

CORINTH, MISSISSIPPI — The Alcorn County ARES will hold the April Fool – Jess Ables Memorial Hamfest from 9 am. to 5 p.m., Saturday, April 1 and from 8 a.m. to noon, Sunday, April 2 at the Crossroads Arena, 2800 South Harper Road. Email: <Harold.butler@me.com>. Website: <www.acares.reiselt.com>. Talk-in 146.925. VE exams.

CLAREMORE, OKLAHOMA — The Green Country Hamfest 2023 and the **2023 ARRL Oklahoma Section Convention** will be held from 4-9 p.m., Friday, April 7 and from 8 a.m. to 3 p.m., Saturday, April 8 at the Claremore Expo Center, 400 Veterans Parkway. Email: <info@greencountryhamfest.org>. Website: <www.greencountryhamfest.org>. Talk-in 147.090+ (PL 88.5). VE exams, DXCC / WAC / WAS / VUCC card checking.

HAMPTON, NEW HAMPSHIRE — The Port City Amateur Radio Club will hold the **Seacoast Amateur Radio Flea Market** from 8 a.m. to noon, Saturday, April 8 at the St. James Masonic Lodge, 77 Tide Mill Road. Contact: Steve Roberts, KC1ILT, <kc1ilt@maine.rr.com>. Website: <www.w1wqm.org>. Talk-in 145.150- (PL 127.3). VE exams.

HAYES, VIRGINIA — The Middle Peninsula Amateur Radio Club will hold the **3rd Annual Gloucester Hamfest** from 9 a.m. to 4 p.m., Saturday, April 8 at the Abingdon Ruritan Club, 8784 Guinea Road. Contact: Joy Safrenek, (757) 871-7772. Email: <w2jms2001@gmail.com>. Talk-in 145.370.

RALEIGH, NORTH CAROLINA — The Raleigh Amateur Radio Society will hold **RARSfest** and the **2023 ARRL Roanoke Division Convention** from 8 a.m. to 3 p.m., Saturday, April 8 at the Jim Graham Building, NC State Fairgrounds, 4285 Trinity Road. Contact: Chuck Littlewood, K4HF, (919) 630-9358. Email: <k4hf953@yahoo.com>. Website: <www.rarsfest.org>. Talk-in 146.64. VE exams.

CUYAHOGA FALLS, OHIO — The Cuyahoga Falls Amateur Radio Club will hold its 67th Annual Hamfest from 8 a.m. to 1 p.m., Saturday, April 15 at the Emidio & Sons Expo Center, 48 E. Bath Road. Contact: Bruce Ferry, (330) 790-1680. Email: <hamfest2023@w8vpv.org>. Website: <www.w8vpv.org/hamfest>. Talk-in 147.270+ (PL 110.9) or 444.850+ (PL 110.9). Free VE exams.

GEORGETOWN, DELAWARE — The Sussex Amateur Radio Association will hold the **Georgetown Hamfest** and **2023 ARRL Delaware State Convention** beginning 8 a.m., Saturday, April 15 at the Cheer Community Center, 20520 Sand Hill Road. Contact: Jamie, W3UC, (410) 202-7690. Email: <hamfestdelaware@gmail.com>. Website: <www.radioelectronicsexpo.com>. Talk-in 147.090 (PL 156.7). Free VE exams, DXCC / VUCC / WAS / WAC card checking.

ROSWELL, NEW MEXICO — The Pecos Valley Amateur Radio Club will hold the Second Annual PVARC Alien City Hamfest from 8 a.m. to 2 p.m., Saturday, April 15 at Beginnings, 3908 SE Main Street. Contact Gerald Cox, WØCOX, (575) 840-8586. Email: <w0cox@gmai.com>. Website: <www.pecosvalleyarc.com>. Talk-in 147.320 (PL 146.2).

STOUGHTON, WISCONSIN — The Madison Area Repeater Association will hold the 52nd Annual Madison Hamfest from 8 a.m. to noon, Saturday, April 15 at the Mandt Community Center, 400 Mandt Parkway. Phone: (608) 205-1994. Email: <hamfest@w9hsy.org>. Website: <www.w9hsy.org>. Talk-in 147.150+ (PL 123). VE exams.

ELIZABETH, PENNSYLVANIA — The Two Rivers Amateur Radio Club will hold the **51st Annual Amateur Radio / Computer Show** 8 a.m. to 2 p.m., Sunday, April 16 at the Elizabeth VFD Bingo Hall, 101 South 1st Avenue. Contact: Bill Powers (412) 260-5699 or Del Peterson (412) 974-9695. Email: <hamfestchairman@trarc.net>. Website: <www.trarc.net>. Talk-in 146.73. VE exams.

DOVER, OHIO — The Tusco Amateur Radio Club will hold its **2023 Hamfest, Computer & Electronics Show** from 8 a.m. to 1 p.m., Saturday, April 22 at the Tuscarawas County Fairgrounds, 259 S. Tuscarawas Avenue. Contact: Rick Dingman, KE8URA, (303) 934-0575 or Cindy Gray, KE8JNN, (330) 340-4946. Email: <w8zx@n8bag.bet>. Website: <www.w8zx.net>. Talk-in 146.730.

LANDING, NEW JERSEY — The Splitrock Amateur Radio Association will hold the **2023 North Jersey Tailgate Hamfest** beginning 8 a.m., Saturday, April 22 at the Landing Park Recreation Complex, 165 Landing Road. Email: <hamfest@splitrockara.org>. Website: <www.splitrockara.org>. Talk-in 146.985- (PL 131.8). DXCC card checking.

SONOMA, CALIFORNIA — The Valley of the Moon Amateur Radio Club will hold its **Hamfest 2023** from 8 a.m. to noon, Saturday, April 22 at the First Congregational Church of Sonoma, 252 W. Spain Street. Email: <valleyofthemoonarc@gmail.com>. Website:<www.vomarc.org>. Talk-in 145.350 (88.5). VE exams, fox hunt.

ODENTON, MARYLAND — The Maryland Mobileers Amateur Radio Club will hold the **MMARC Spring Hamfest** from 7:30 a.m. to noon, Sunday, April 23 at the Odenton Volunteer Fire Department, 1425 Annapolis Road (Rt. 175). Contact: Bruce, AB3AC, (410) 456-2500. Email: <bmcpherson73@verizon.net>. Website: <https://tinyurl.com/2p935p6k>. Talk-in 146.805- (PL 107.2).

OCALA, FLORIDA — The Marion County Emergency Radio Team will air a special event station **KG4NXO** from 1200-2359 UTC, Saturday, April 29 to celebrate 20 years of amateur radio support for Marion County Emergency Management. Frequencies include 14.262, 7.262 MHz and D-STAR on 146.790 MHz REF 037. Request further information about Certificate & QSL at the website <www.mert20.org>.

SPRING GROVE, PENNSYLVANIA — The York Hamfest Foundation will hold the **2023 York Hamfest** from 8 a.m. to 1 p.m., Saturday, April 29 at Elicker's Grove Park, 511 Roth Church Road. Email: <duane.sternee@yahoo.com>. Website: <www.yorkhamfest.org>. Talk-in 147.330+ (PL 123). Free VE exams, DXCC / VUCC / WAS / WAC card checking.

MAY

CADILLAC, MICHIGAN — The Wexaukee Amateur Radio Club will hold the **63rd Annual Cadillac Amateur Radio and Computer Swap** beginning 8 a.m., Saturday, May 6 at the Mackinaw Trail Middle School, 8401 S. Mackinaw Trail. Website: <www.wexaukee.org>. Talk-in 146.980. VE exams, card checking.

CEDARBURG, WISCONSIN — The Ozaukee Radio Club will hold its **43rd Spring Indoor Swapfest** from 8 a.m. to noon, Saturday, May 6 at the Ascension Columbia St. Mary's Center, W67N890 Washington Avenue. Contact Tom Trethewey, KC9ONY, (262) 421-6351. Email: <swapfest@ozaukeeradioclub.org>. Website: <www.ozaukeeradioclub.org>. Talk-kin 146.97- (PL 127.3).

SANDWICH, ILLINOIS — The Kishwaukee Amateur Radio Club will hold **The DeKalb Hamfest** from 8 a.m. to 1 p.m., Sunday, May 7 at the Sandwich Fairgrounds, 1401 Suydam Road. Contact: Bob Yurs, W9ICU, (815) 757-3219. Email: <w9icu@arrl.net>. Website: <www.karc-club.org>. Talk-in 146.730- (PL 100).

TOLEDO, OHIO — The Lucas County ARES will hold its **Trunk Sale & Swap Meet** from 9 a.m. to 1:30 p.m., Sunday, May 7 at the Toledo Speedway, 5639 Benore Road. Phone: (419) 370-2882. Email: <swap@lucasares.org>. Website: <http://swap.lucasares.org>. Talk-in 146.940- (PL 103.5).

PRESCOTT VALLEY, ARIZONA — The Yavapai Amateur Radio Club will hold the **2023 Prescott Hamfest** from 8 a.m. to noon, Sunday, May 13 at the Granville Elementary School, 5250 Stover Drive. Contact: John Stover, KT7P, <hamfest@w7yrc.org>. Website: <www.prescotthamfest.org>. Card checking.

STANWOOD, WASHINGTON — The Stanwood-Camano Amateur Radio Club will hold the **SCARC 30th Annual Electronic Flea Market & Hamfest** from 9 a.m. to 1 p.m., Saturday, May 13 at the Stanwood Middle School, 9405 271st Street NW. Email: <scarchamfest@yahoo.com>. Website: <www.scarcwa.org>.

XENIA, OHIO — The Dayton Amateur Radio Association will hold the **Dayton Hamvention 2023** from 9 a.m. to 5 p.m., Friday, May 19; 9 a.m. to 5 p.m., Saturday, May 20; and 9 a.m. to 1 p.m., Sunday, May 21 at the Greene County Fair and Expo Center, 210 Fairground Road. Phone: (937) 276-6930. Email: <info@hamvention.org>. Website: <www.hamvention.org>. Talk-in 146.94- (PL 123). VE exams, card checking, special event station W8BI.

behind the bylines...

… a little bit about some of the authors whose articles appear in this issue.

Steven K. Smith, K3SKS ("Persistent Practice Produces Positive POTA Progress," p. 25), retired five years ago from a career in electrical engineering. He is now putting his skills to use in building and improving the ham station that he shares with his wife, Judy, KC3JAS, who has become very active as an "activator" in the Parks on the Air (POTA) program. A ham since 2017, Steven upgraded to Extra only three months after passing his Technician exam and is now a Volunteer Examiner himself, working with a group that conducts regular licensing classes, exam sessions and new ham workshops. He and Judy live in DuBois, Pennsylvania.

Bob Herklotz, K4HRK ("A Collapsible Tri-Band Antenna…" p. 33), is an Extra Class ham and a member of the Maury County Amateur Radio Club in Columbia, Tennessee. His lifelong interest in radio and electronics was sparked by listening to shortwave on his grandparents' RCA "Magic Eye" console radio when just a kid. A retired auto industry maintenance planner, he is currently winding down his "retirement business," Fresh Aero Aviation, to spend more time on other pursuits — like ham radio.

Nicholas Petreley, N2EWS ["The Continuing Anticlimactic Adventures of the Perverted V (Part 3)," p. 38], was an award-winning columnist for the computer journal *InfoWorld* in a former life; a teacher, consultant, and programmer in a former, former life, and is currently a technical consulting engineer for Cisco Systems, Inc. You can reach him at <nicholas@petreley.com>.

Tom Weaver, WØFN ("Learning Morse Code Instant Character Recognition," p. 40), first became a ham in 1977 but let his license lapse and returned in 2018 — immediately jumping to Extra Class! After discovering CW Academy in 2019, he quickly became not only a code aficionado, but a CW Academy Advisor and, last summer, began coaching Instant Character Recognition — the subject of his article — for the Long Island CW Club. Until the COVID pandemic, he also taught indoor rock-climbing! Steven and his wife live in Des Moines, Iowa.

Number groups after callsigns denote the following: Band, Final Score, QSOs, Zones, Countries, US/VE QTHs. An asterisk (*) indicates low power. Certificate winners are listed in boldface. Late logs are listed in italics.

Let CQ help you get the most for your advertising dollar!
Contact Dottie K, CQ's Advertising Director
at 516-681-2922 x 106 or via email at ads@cq-amateur-radio.com

hamshop

Advertising Rates: Non-commercial ads are 20 cents per word including abbreviations and addresses. Commercial and organization ads are $1.00 per word. Boldface words are $1.50 each (specify which words). Minimum charge $2.00. No ad will be printed unless accompanied by full remittance. All ads must be typewritten double-spaced.
Closing Date: The 10th day in the third month preceding date of publication (example: Jan. 10th for the March issue). Because the advertisers and equipment contained in Ham Shop have not been investigated, the Publisher of *CQ* cannot vouch for the merchandise listed therein. The publisher reserves the right to reject any advertisement. Direct all correspondence and ad copy to: CQ Ham Shop, P.O. Box 1206, Sayville, NY, 11782 (e-mail: <hamshop@cq-amateur-radio.com>).

Fun to read, interesting from cover to cover, written so you can understand it. That's CQ. Read and enjoyed by thousands of people each month!

The changes in amateur radio over the years have been astounding. Still some things have remained remarkably the same, namely the type of people who are drawn to the hobby. As a group, hams have a tremendous amount of knowledge on a wide array of topics, an amazing willingness to share that knowledge with each other, and an unwavering commitment to helping neighbors, near or far, in times of need.

So whether you are an old-timer or new to the hobby accept the challenge and read *CQ*. *SUBSCRIBE TODAY!*
